1.0 EXECUTIVE SUMMARY

QuikTrip 4263 is proposed to be located near the southeast corner of the Parker Road (SH-83) and Havana Street (SH-30) intersection in Aurora, Colorado. The project is proposed to include an 18-fueling position gas station with a 5,312 square foot convenience to redevelop the previous diner restaurant currently located within the existing retail center. It is expected that the project will be completed in the next couple years. Therefore, analysis was conducted for the 2026 short-term buildout horizon as well as the 2050 long-term twenty-year planning horizon.

The purpose of this traffic study is to identify project traffic generation characteristics to determine potential project traffic related impacts on the local street system and to develop the necessary mitigation measures required for the identified traffic impacts. The intersection of Parker Road (SH-83) and Havana Street (SH-30) was incorporated into this traffic study in accordance with the City of Aurora and State of Colorado Department of Transportation (CDOT) standards and requirements:

In addition, the existing full movement accesses along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue to remain were evaluated.

Regional access to the site will be provided by Interstate 225 (I-225). Primary access will be provided by Parker Road (SH-83) and Havana Street (SH-30). Direct access will be provided by the existing full movement intersections along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue.

With 18 fueling positions and an approximate 5,312 square foot convenience store, QuikTrip 4263 is expected to generate approximately 4,628 daily weekday driveway trips, with 487 of these trips occurring during the morning peak hour and 410 trips occurring during the afternoon peak hour. Accounting for pass-by, expected net new (non pass-by) trips to the surrounding street network results in approximately 1,158 weekday daily trips, of which 117 trips and 102 trips are anticipated during the weekday morning and afternoon peak hours, respectively.

Based on the analysis presented in this report, Kimley-Horn believes QuikTrip 4263 will be successfully incorporated into the existing and future roadway network. Analysis of the existing street network, the proposed project development, and expected traffic volumes resulted in the following conclusions and recommendations:

- The threshold for requiring an access permit along Colorado Department of Transportation (CDOT) roadways occurs when project traffic is anticipated to increase the existing access traffic volumes by more than 20 percent. Based on traffic projections, the addition of project traffic on the south leg of the Parker Road (SH-83) and east leg of the Havana Street (SH-30) project accesses are anticipated to increase existing traffic by more than 20 percent. Therefore, access permits are anticipated to be needed at these two intersections accesses as development occurs.
- Direct access to the site will utilize the three existing full movement accesses along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue that currently serve the overall shopping center. The project access intersections along Havana Street and Parker Road currently provide stop control on the approaches exiting the existing development; therefore, a R1-1 “STOP” sign is recommended to be placed on the southbound approach, exiting the site onto Yale Avenue.
- If 2050 volumes are realized, the second northbound left turn lane that is currently striped out at the Parker Road (SH-83) and Havana Street (SH-30) intersection is recommended to be striped to provide dual left turn lanes. The dual left turn lanes are recommended to operate with protected-only left turn phasing. Additionally, the third westbound through lane may need to be implemented within the existing pavement shoulder. Therefore, the westbound right turn lane will convert to a shared through/right turn lane and the southbound to westbound acceleration will become the third receiving through lane.
- Any onsite or offsite improvements should be incorporated into the Civil Drawings and conform to standards of the City of Aurora, Colorado Department of Transportation, and the Manual on Uniform Traffic Control Devices (MUTCD) – 11th Edition, 2023.

2.0 INTRODUCTION

Kimley-Horn has prepared this report to document the results of a Traffic Impact Study for QuikTrip 4263 proposed to replace a previous restaurant located on the southeast corner of the Parker Road (SH-83) and Havana Street (SH-30) intersection in Aurora, Colorado. A vicinity map illustrating the project development location is shown in **Figure 1**. The project is proposed to include an 18-fueling position gas station with a 5,312 square foot convenience store. A conceptual site plan is attached in **Appendix A**. It is expected that the project will be completed in the next couple years; therefore, analysis was conducted for the 2026 short-term buildout horizon as well as the 2050 long-term twenty-year planning horizon.

The purpose of this traffic study is to identify project traffic generation characteristics to determine potential project traffic related impacts on the local street system and to develop the necessary mitigation measures required for the identified traffic impacts. The intersection of Parker Road (SH-83) and Havana Street (SH-30) was incorporated into this traffic study in accordance with the City of Aurora and State of Colorado Department of Transportation (CDOT) standards and requirements:

In addition, the existing full movement accesses along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue to remain were evaluated.

Regional access to the site will be provided by Interstate 225 (I-225). Primary access will be provided by Parker Road (SH-83) and Havana Street (SH-30). Direct access will be provided by the existing full movement intersections along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue.

VICINITY MAP

3.0 EXISTING AND FUTURE CONDITIONS

3.1 Existing Study Area

The existing site is a vacant restaurant and associated parking lot. To the north and south are commercial uses composed mainly of strip retail stores and office buildings. To the east are multi-family and single-family residential homes. To the west of the site is the Babi Yar Park, an apartment complex, and multi-family residential homes.

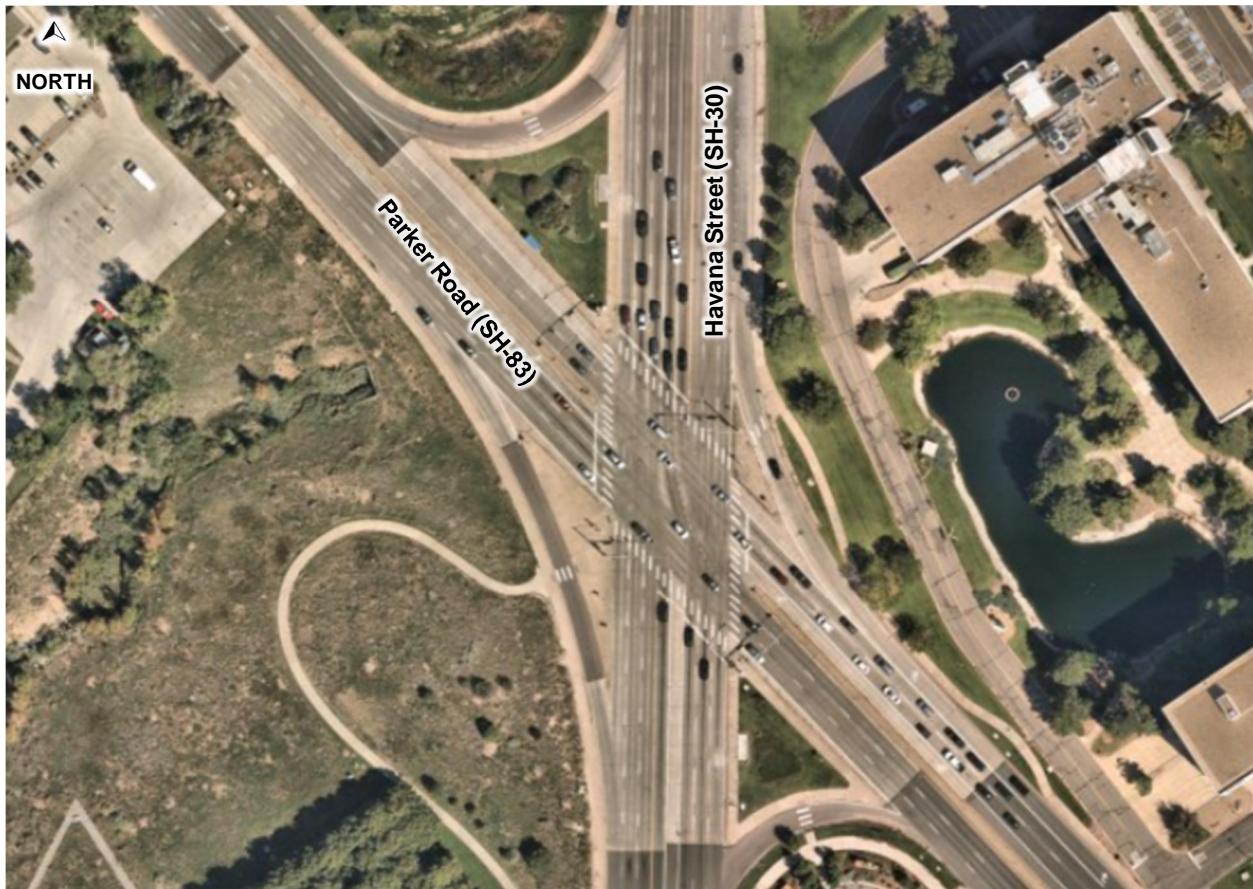

3.2 Existing Roadway Network

Parker Road (SH-83) extends primarily east/west with three through lanes in each direction and a two-way left turn lane (TWLTL) east of the studied project access along Parker Road and raised center median west of this access. The road runs diagonally from E-470 to Colorado Boulevard (CO-2) as a northeast/southwest roadway. However, in this study the roadway will be the east/west roadway in the intersection. The posted speed limit along Parker Road (SH-83) near the project site is 45 miles per hour. This roadway is classified as a R-A Regional Highway.

Havana Street (SH-30) is a north/south roadway with three through lanes in each direction. The posted speed limit along Havana Street (SH-30) is 45 miles per hour in both directions. As State Highway 30, it extends from Hamden Avenue to 6th Avenue as a NR-B Non-Rural Arterial.

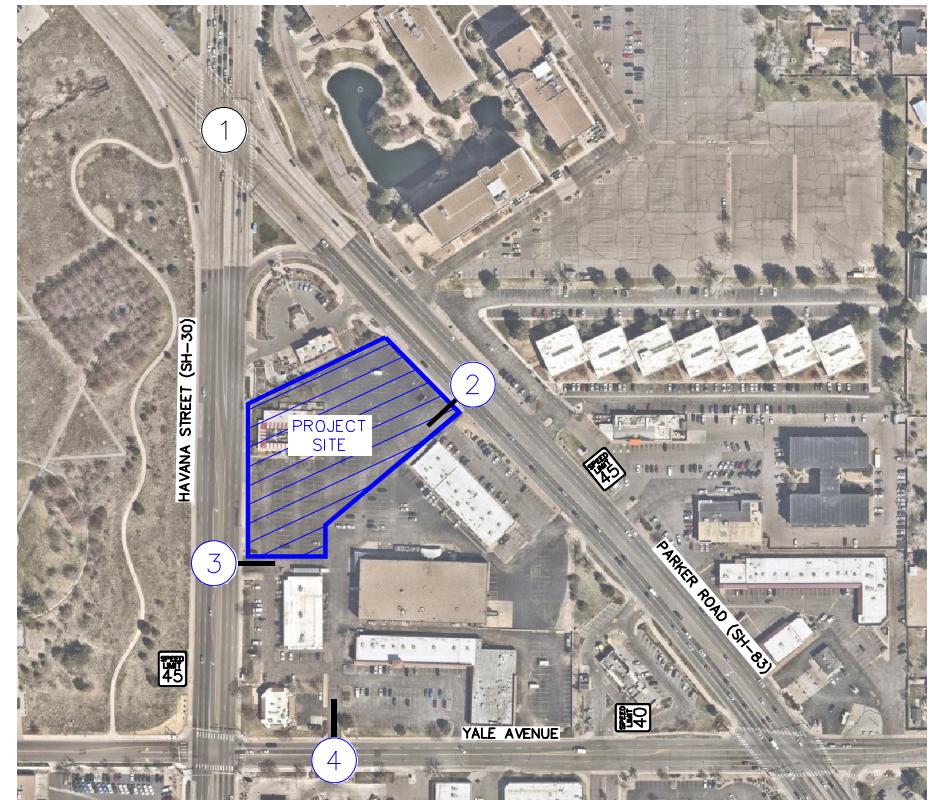

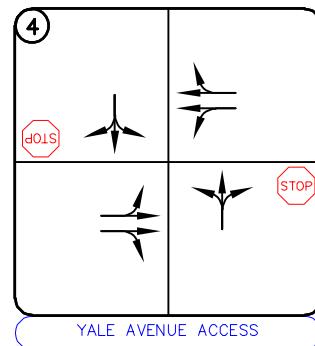

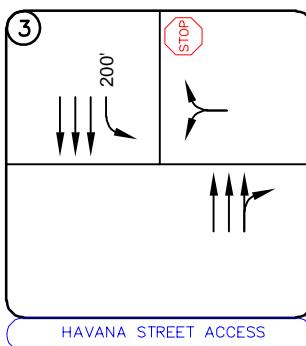

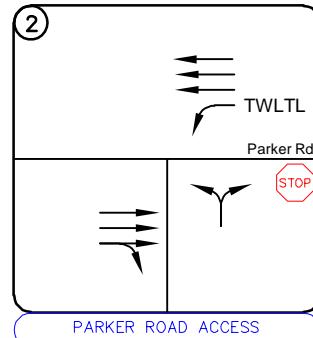

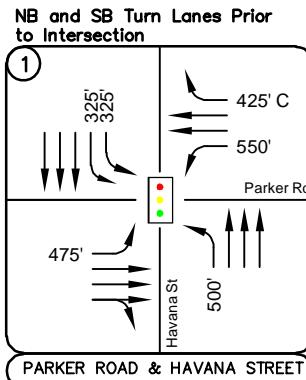

Yale Avenue is an east/west roadway with two through lanes in each direction. The posted speed limit along Yale Avenue is 40 miles per hour. It extends from Elmira Street to Chamber Road as a Minor Arterial Roadway.

The signalized intersection of Parker Road (SH-83) and Havana Street (SH-30) operates with protected permissive left turn phasing on the east/west Parker Road (SH-83) legs and protected-only left turn phasing on the north/south Havana Street (SH-30) legs. The northbound approach provides a left turn lane and three through lanes with the outside through lane being a shared through/channelized right turn lane. The southbound approach provides dual left turn lanes and three through lanes with the outside through lane being a shared through/channelized right turn lane. The eastbound approach provides a left turn lane and three through lanes with the outside through lane being a shared through/channelized right turn lane. The westbound approach provides a left turn lane, two through lanes and a channelized right turn lane. An aerial photo of the existing intersection configuration is below.

Parker Road (SH-83) and Havana Street (SH-30)

The intersection lane configuration and control for the study area intersections are shown in **Figure 2**.

EXISTING GEOMETRY AND CONTROL

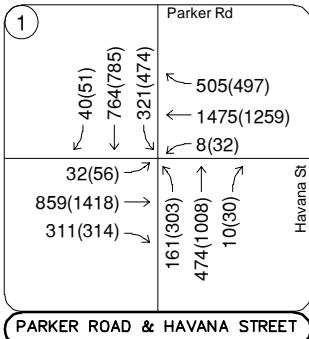

3.3 Existing Traffic Volumes

Existing turning movement counts were conducted at the study intersections on Tuesday, May 14, 2024 during the weekday morning and afternoon peak hours. The counts were conducted during the morning and afternoon peak hours of adjacent street traffic in 15-minute intervals from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM on this count date. The existing intersection traffic volumes are shown in **Figure 3** with count sheets provided in **Appendix B**.

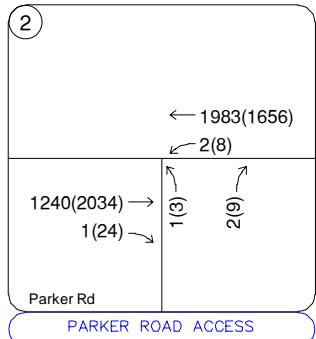

3.4 Unspecified Development Traffic Growth

According to traffic projections from the Denver Regional Council of Governments (DRCOG) traffic model, the area surrounding the site is expected to have an average 30-year growth factor of 1.17. This growth factor equates to an annual growth rate of 0.53 percent. Additionally, according to information provided on the website for the Colorado Department of Transportation (CDOT), the 20-year growth factor along Parker Road (SH-83) in the vicinity of the site is between 1.09 and 1.14 with an average of 1.11. This 20-year growth factor equates to annual growth rate of 0.54 percent. The 20-year growth factor along Havana Street (SH-30) in the vicinity of the site is between 1.09 and 1.10 with an average of approximately 1.10. This 20-year growth factor equates to annual growth rate of 0.45 percent. Traffic information from the CDOT Online Transportation Information System (OTIS) website and the DRCOG traffic projections are included in **Appendix C**. To be conservative, the highest expected growth rate of these sources of 0.54 percent was used. This annual growth rate was used to estimate near-term 2026 and long-term 2050 traffic volume projections at the key intersection. Background traffic volumes for 2026 and 2050 are shown in **Figures 4** and **5**, respectively.

4.0 PROJECT TRAFFIC CHARACTERISTICS

4.1 Trip Generation

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land use to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation rates is the *Trip Generation Manual*¹ published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses. For this study, Kimley-Horn used the ITE Trip Generation Report average rates that apply to Convenience Store/Gas Station (ITE 945) for traffic associated with the development.

Since the project is a commercial development, pass-by trips are expected. These pass-by trips are vehicles already on the street network that will be attracted to the project site en route to a final destination. The pass-by percentages were obtained from the ITE "Trip Generation Manual", Eleventh Edition which shows a morning peak hour pass-by percentage of 76 percent and an afternoon peak hour pass-by percentage of 75 percent.

With 18 fueling positions and an approximate 5,312 square foot convenience store, QuikTrip 4263 is expected to generate approximately 4,628 daily weekday driveway trips, with 487 of these trips occurring during the morning peak hour and 410 trips occurring during the afternoon peak hour. Accounting for pass-by, expected net new (non pass-by) trips to the surrounding street network results in approximately 1,158 weekday daily trips, of which 117 trips and 102 trips are anticipated during the weekday morning and afternoon peak hours, respectively. Calculations were based on the procedure and information provided in the ITE *Trip Generation Manual, 11th Edition – Volume 1: User's Guide and Handbook*, 2021. **Table 1** summarizes the estimated trip generation for the site. The trip generation worksheets are included in **Appendix D**.

¹ Institute of Transportation Engineers, *Trip Generation Manual*, Eleventh Edition, Washington DC, 2021.

Table 1 – QuikTrip 4263 Traffic Generation

Convenience Store/Gas Station (ITE 945) 18 FP/5,312 SF	Daily	Weekday Vehicle Trips					
		AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
Non Pass-By Trips	1,158	58	59	117	51	51	102
Pass-By Trips	3,470	185	185	370	154	154	308
Total Project Trips	4,628	243	244	487	205	205	410

4.2 Trip Distribution

Distribution of site traffic on the street system was based on the area street system characteristics, existing traffic patterns, existing and anticipated surrounding demographic information, and the proposed access system for the project. The directional distribution of traffic is a means to quantify the percentage of site-generated traffic that approaches the site from a given direction and departs the site back to the original source. The project trip distribution for the proposed development is illustrated in **Figure 6**.

Since the project is a commercial development, a certain amount of traffic attracted to the gas station will already be passing by the site. This pass-by distribution is a means to quantify the amount of traffic arriving to the site from a given direction and then leaving the site in the same original direction of travel, continuing the driver's trip. The expected weekday morning and afternoon peak hour pass-by trip distributions were calculated based on actual traffic volumes at the intersection of Parker Road (SH-83) and Havana Street (SH-30). Directional differences in the morning and afternoon peak hours were accounted for in the pass-by distributions as shown in **Figures 7** and **8**, respectively.

4.3 Traffic Assignment & Total (Background Plus Project) Traffic

QuikTrip 4263 traffic assignment was obtained by applying the project trip distribution to the estimated traffic generation of the development shown in **Table 1**. The non pass-by project traffic assignment is shown in **Figure 9** while the pass-by project traffic assignment is shown in **Figure 10**. Site traffic volumes were added to the background volumes to represent estimated traffic conditions for the short-term 2026 buildout horizon and long-term 2050 twenty-year planning horizon. These total traffic volumes for the study area are illustrated for the 2026 and 2050 horizon years in **Figures 11** and **12**, respectively.

5.0 TRAFFIC OPERATIONS ANALYSIS

Kimley-Horn's analysis of traffic operations in the site vicinity was conducted to determine potential capacity deficiencies in the 2026 and 2050 development horizons at the identified key intersections. The acknowledged source for determining overall capacity is the *Highway Capacity Manual (HCM)*².

5.1 Analysis Methodology

Capacity analysis results are listed in terms of Level of Service (LOS). LOS is a qualitative term describing operating conditions a driver will experience while traveling on a particular street or highway during a specific time interval. It ranges from A (very little delay) to F (long delays and congestion). According to City of Aurora guidelines for signalized intersections, individual movements may be allowed to fall to LOS E, but in most cases the overall intersection must operate (or be projected to operate) at a LOS D or better during morning and afternoon peak periods. If the existing LOS for an intersection is less than LOS D, potential alternatives to improve the intersection to achieve LOS D or to maintain the existing critical lane volume with the addition of site generated traffic are provided. Minor movements at unsignalized intersections, such as left turns onto a major arterial from a side street, may be allowed to fall below LOS D pending the specific conditions. Movements which have a light traffic demand as well as a viable travel alternative may be allowed to fall below LOS D. **Table 2** shows the definition of level of service for signalized and unsignalized intersections.

Table 2 – Level of Service Definitions

Level of Service	Signalized Intersection Average Total Delay (sec/veh)	Unsignalized Intersection Average Total Delay (sec/veh)
A	≤ 10	≤ 10
B	> 10 and ≤ 20	> 10 and ≤ 15
C	> 20 and ≤ 35	> 15 and ≤ 25
D	> 35 and ≤ 55	> 25 and ≤ 35
E	> 55 and ≤ 80	> 35 and ≤ 50
F	> 80	> 50

Definitions provided from the Highway Capacity Manual, Sixth Edition, Transportation Research Board, 2016.

² Transportation Research Board, *Highway Capacity Manual*, Sixth Edition, Washington DC, 2016.

Study area intersections were analyzed based on average total delay analysis for signalized and unsignalized intersections. Under the unsignalized analysis, the LOS for a two-way stop-controlled intersection is determined by the computed or measured control delay and is defined for each minor movement. LOS for a two-way stop-controlled intersection is not defined for the intersection as a whole. LOS for signalized, roundabout, and all-way stop controlled intersections are defined for each approach and for the overall intersection.

5.2 Key Intersection Operational Analysis

Calculations for the operational level of service at the key intersections for the study area are provided in **Appendix E**. The existing year analysis is based on the lane geometry and intersection control shown in **Figure 2**. Existing peak hour factors were utilized in the analysis. The existing heavy vehicle percentages obtained from the turning movement counts were also used in each horizon year. The signalized intersection analysis utilizes the observed cycle lengths with optimized phasing and timing. Based on increased national attention given to establishing appropriate yellow and all-red clearance intervals to improve intersection safety, these have been calculated and are applied for approaches at the signalized intersections. The increase in yellow and all red time sacrifices intersection capacity for improved safety. Synchro traffic analysis software was used to analyze the signalized and unsignalized key intersections for HCM level of service.

Parker Road (SH-83) & Havana Street (SH-30)

The signalized intersection of Parker Road (SH-83) and Havana Street (SH-30) operates with protected permissive left turn phasing on the east/west Parker Road (SH-83) legs and protected-only left turn phasing on the north/south Havana Street (SH-30) legs. Of note, the southbound and northbound right turn movements occur prior to the intersection. Therefore, these volumes are not included in the intersection analysis. The intersection currently operates at LOS D during the morning and afternoon peak hours based on the existing intersection configuration and control. With project traffic, the intersection is expected to continue operating acceptably at LOS D during both peak hours. However, if 2050 volumes are realized, the second northbound left turn lane that is currently striped out is recommended to be striped to provide dual left turn lanes. The dual left turn lanes are recommended to operate with protected-only left turn phasing. Additionally, the third westbound through lane may need to be implemented within the existing pavement shoulder. Therefore, the westbound right turn lane will convert to a shared through/right turn lane

and the southbound to westbound acceleration will become the third receiving through lane. With these recommendations, the intersection is anticipated to operate acceptably. **Table 3** provides the results of the LOS analysis conducted at this intersection.

Project Accesses

A project access analysis has been provided for the three existing full movement accesses along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue that currently serve the existing overall shopping center. The project access intersections currently provide stop control on the approaches exiting the existing development. Of note, a R1-1 “STOP” sign is recommended to be placed on the southbound approach, exiting the site onto Yale Avenue. **Table 4** provides the results of the level of service analysis for the project access intersections. As shown in the table, the three project access intersections are anticipated to have all movements operating with acceptable LOS D or better during the peak hours in the long-term horizon with the planned configuration.

Table 4 – Project Access Level of Service Results

Intersection	2026 Total				2050 Total			
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
	Delay (sec/veh)	LOS						
Parker Road Access Northbound Approach Westbound Left	15.5 14.9	C B	19.8 21.1	C C	17.9 16.8	C C	24.1 26.5	C D
Havana Street Access Westbound Approach Southbound Left	12.0 9.6	B A	14.5 12.0	B B	11.2 9.5	B A	14.2 12.7	B B
Yale Avenue Access Northbound Approach Eastbound Left Westbound Left Southbound Approach	10.7 8.4 7.6 12.1	B A A B	12.1 8.2 8.1 11.7	B A A B	11.4 8.6 7.7 13.1	B A A B	13.4 8.3 8.3 12.5	B A A B

5.3 CDOT Access Permit Determination

The threshold for requiring an access permit along Colorado Department of Transportation (CDOT) roadways occurs when project traffic is anticipated to increase the existing access traffic volumes by more than 20 percent. Based on traffic projections, the addition of project traffic on the south leg of the Parker Road (SH-83) and east leg of the Havana Street (SH-30) project accesses are anticipated to increase existing traffic by more than 20 percent. Therefore, access permits are anticipated to be needed at these two intersections accesses as development occurs.

However, the addition of project traffic on the all four legs of Parker Road (SH-83) and Havana Street (SH-30) intersection is not anticipated to increase existing access traffic volumes by more than 20 percent, Therefore, a CDOT access permit is not anticipated to be required in association with this project at the Parker Road (SH-83) and Havana Street (SH-30) intersection.

5.4 Auxiliary Turn Lane Warrant & Length Analysis

Auxiliary turn lanes along CDOT controlled highways are to be implemented based on volume threshold requirements set forth in the State Highway Access Code. Further, turn lane lengths should be designed based on the State Highway Access Code. Parker Road (SH-83) is classified as a Regional Highway (R-A) with a posted speed limit of 45 miles per hour. Whereas Havana Street (SH-30) is classified as a Non-Rural Arterial (NR-B) with a posted speed limit of 45 miles per hour. Additionally, the City of Aurora defaults to the Colorado Department of Transportation (CDOT) State Highway Access Code guidelines to determine if turn lanes are warranted at studied intersections. CDOT classifies their state highways based on roadway types. It is believed that Yale Avenue matches the characteristics of a CDOT Non-Rural Arterial (NR-C) roadway.

Of note, since Parker Road (SH-83) and Havana Street (SH-30) both provide three through lanes in each direction near the project accesses, the auxiliary right turn lane can be absorbed within the third through lane per CDOT guidelines. Additionally, southbound left turn lanes are already provided along Parker Road (SH-83) and Havana Street (SH-30) at the project access intersections within the existing two-way left turn center lane.

However, the Yale Avenue access intersection turn lane guidelines will follow the State Highway Access Code for category NR-C roadways. The following threshold applies for determining the need for a turn lane:

- A left turn lane with storage length plus taper length is required for any access with a projected peak hour left ingress turning volume greater than 25 vehicles per hour (vph). If the posted speed is greater than 40 mph, a deceleration lane and taper is required for any access with a projected peak hour left ingress turning volume greater than 10 vph.
- A right turn lane with storage length plus taper is required for any access with a projected peak hour right ingress turning volume greater than 50 vehicles per hour. If the posted speed limit is greater than 40 miles per hour, a right turn lane deceleration lane and taper is required for any access with a project peak hour right ingress turning volume greater than 25 vehicles per hour.

Based on the 2050 traffic volume projections, turn lane requirements at the project access intersection along Yale Avenue are as follows:

- An eastbound left turn lane **is not** warranted along Yale Avenue at the existing access based on projected 2050 background plus project traffic volumes being eight (8) eastbound left turns during the peak hour and the threshold being 25 vph.
- A westbound right turn lane **is not** warranted along Yale Avenue at the existing access based on projected 2050 background plus project traffic volumes being nine (9) westbound right turns during the peak hour and the threshold being 50 vph.

5.5 Vehicle Queuing Analysis

A vehicle queuing analysis was conducted for the study area intersections. The queuing analysis was performed using Synchro presenting the results of the 95th percentile queue lengths. Results are shown in the following **Table 5** with calculations provided within the level of service operational sheets of **Appendix E** for unsignalized intersections and **Appendix F** for signalized intersections.

Table 5 – Turn Lane Queuing Analysis Results

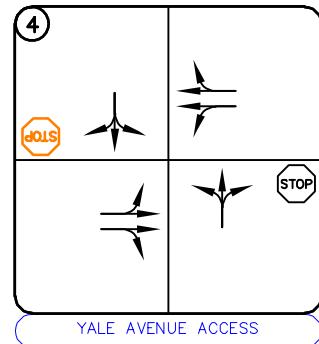

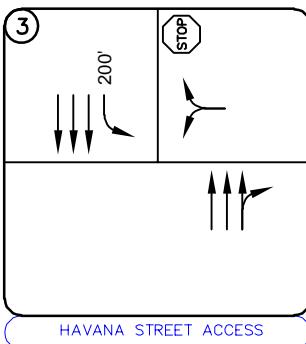

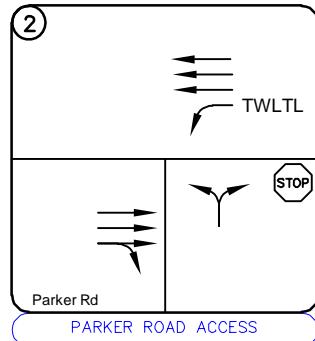

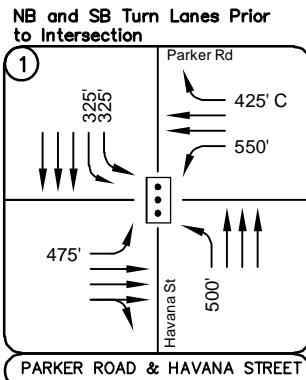

Intersection Turn Lane	Existing Turn Lane Length	2026 Calculated Queue	2026 Recommended Length	2050 Calculated Queue	2050 Recommended Length
Parker Rd & Havana St					
Eastbound Left	475'	48'	475'	56'	475'
Westbound Left	550'	25'	550'	25'	550'
Westbound Right	425'	25'	425'	-	-
Northbound Left	500'	425'	500'	192' DL	500' /375'
Southbound Left	325' DL	296' DL	325' DL	335' DL	325' DL
Parker Road Access					
Westbound Left	TWLTL	TWLTL	TWLTL	TWLTL	TWLTL
Havana Street Access					
Southbound Left	200'	25'	25'	25'	25'

DL = Dual Left Turn Lane; **Blue Text** = Recommendation, TWLTL= Two-Way Left Turn Lane

The vehicle queues are all anticipated to remain within the existing turn lane lengths though the short-term 2026 horizon. However, if 2050 volumes are realized, then the second northbound left turn lanes is recommended to be striped to provide a length of 375 feet at the intersection of Parker Road (SH-83) and Havana Street (SH-30).

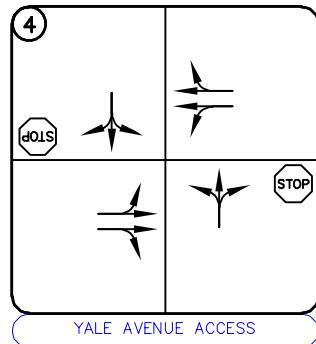

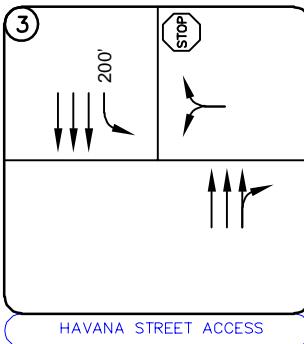

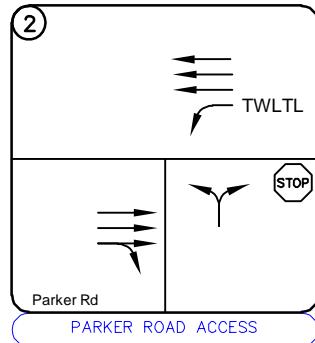

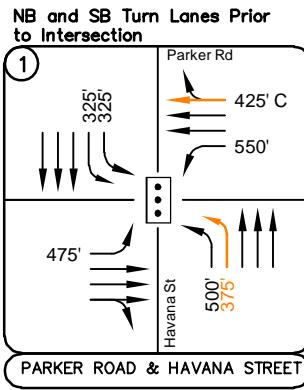

5.6 Improvement Summary

Based on the results of the intersection operational and vehicle queuing analysis, the key intersection recommended improvements and control are shown in **Figure 13** for the 2026 horizon and **Figure 14** for the 2050 horizon.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the analysis presented in this report, Kimley-Horn believes QuikTrip 4263 will be successfully incorporated into the existing and future roadway network. Analysis of the existing street network, the proposed project development, and expected traffic volumes resulted in the following conclusions and recommendations:

- The threshold for requiring an access permit along Colorado Department of Transportation (CDOT) roadways occurs when project traffic is anticipated to increase the existing access traffic volumes by more than 20 percent. Based on traffic projections, the addition of project traffic on the south leg of the Parker Road (SH-83) and east leg of the Havana Street (SH-30) project accesses are anticipated to increase existing traffic by more than 20 percent. Therefore, access permits are anticipated to be needed at these two intersections accesses as development occurs.
- Direct access to the site will utilize the three existing full movement accesses along Parker Road (SH-83), Havana Street (SH-30), and Yale Avenue that currently serve the overall shopping center. The project access intersections along Havana Street and Parker Road currently provide stop control on the approaches exiting the existing development; therefore, a R1-1 “STOP” sign is recommended to be placed on the southbound approach, exiting the site onto Yale Avenue.
- If 2050 volumes are realized, the second northbound left turn lane that is currently striped out at the Parker Road (SH-83) and Havana Street (SH-30) is recommended to be striped to provide dual left turn lanes. The dual left turn lanes are recommended to operate with protected-only left turn phasing. Additionally, the third westbound through lane may need to be implemented within the existing pavement shoulder. Therefore, the westbound right turn lane will convert to a shared through/right turn lane and the southbound to westbound acceleration will become the third receiving through lane.
- Any onsite or offsite improvements should be incorporated into the Civil Drawings and conform to standards of the City of Aurora, Colorado Department of Transportation, and the Manual on Uniform Traffic Control Devices (MUTCD) – 11th Edition, 2023.

APPENDIX D

Trip Generation Worksheets

Kimley»Horn

Project QuikTrip 4263
Subject Trip Generation for Gasoline/Service Station with Convenience Market
Designed by CMF Date 15/15/2024 Job No. 096888046
Checked by _____ Date _____ Sheet No. 1 of 1

TRIP GENERATION MANUAL TECHNIQUES

ITE Trip Generation Manual 11th Edition, Average Rate Equations

Land Use Code - Convenience Store/Gas Station - GFA (4-5.5K) (945)

Independent Variable - Vehicle Fueling Positions (X)

Vehicle Fueling Positions= 18 Positions
X = 18
T = Average Vehicle Trip Ends

Peak Hour of Adjacent Street Traffic, One Hour Between 7 and 9 a.m. (Page 873)

Average Weekday Directional Distribution: 50% ent. 50% exit.
T = 27.04 (X) T = 487 Average Vehicle Trip Ends
T = 27.04 * 18 243 entering 244 exiting

243 + 244 = 487

Peak Hour of Adjacent Street Traffic, One Hour Between 4 and 6 p.m. (Page 874)

Average Weekday Directional Distribution: 50% ent. 50% exit.
T = 22.76 (X) T = 410 Average Vehicle Trip Ends
T = 22.76 * 18.000 205 entering 205 exiting

205 + 205 = 410

Weekday (Page 872)

Average Weekday Directional Distribution: 50% entering, 50% exiting
T = 257.13 (X) T = 4628 Average Vehicle Trip Ends
T = 257.13 * 18.000 2314 entering 2314 exiting

2314 + 2314 = 4628

Non Pass-By Trip Volumes (Per ITE Trip Generation Manual, 11th Edition)

PM Peak Hour = 25%	Non-Pass By	AM Peak Hour = 24%	Non-Pass By
IN	Out	Total	
AM Peak	58	59	117
PM Peak	51	51	102
Daily	579	579	1158

PM Peak Hour Rate Applied to Daily

Pass-By Trip Volumes (Per ITE Trip Generation Manual, 11th Edition)

PM Peak Hour = 75%	Pass By	AM Peak Hour = 76%	Pass By
IN	Out	Total	
AM Peak	185	185	370
PM Peak	154	154	308
Daily	1735	1735	3470

PM Peak Hour Rate Applied to Daily

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
