1.0 EXECUTIVE SUMMARY

Vista Creek Multi-Family is proposed to be located on the southwest corner of the 6th Avenue and Gun Club Road intersection in Aurora, Colorado. For the purposes of this analysis, the project is anticipated to include 321 multifamily dwelling units. It is expected that Vista Creek Multi-Family will be completed in the next several of years; therefore, analysis was conducted for the 2024 and 2045 horizons.

The purpose of this traffic study is to identify project traffic generation characteristics and potential project traffic related impacts on the local street system, as well as to develop mitigation measures required for identified impacts. The following intersections were incorporated into this traffic study in accordance with City of Aurora standards and requirements:

- 6th Avenue and Gun Club Road
- 5th Avenue and Gun Club Road
- 6th Parkway and Gun Club Road
- Colfax Avenue and Gun Club Road/I-70 Frontage Road

Regional access to Vista Creek Multi-Family will be provided by Interstate 70 (I-70), E-470, and Interstate 225 (I-225). Primary access to the project is provided by 6th Parkway and Gun Club Road. Direct access is proposed from the future west legs of 5th Avenue and 6th Avenue at Gun Club Road.

Vista Creek Multi-Family is expected to generate approximately 1,748 weekday daily trips, with 107 of these trips occurring during the morning peak hour and 136 of these trips occurring during the afternoon peak hour.

Based on the analysis presented in this report, Kimley-Horn believes Vista Creek Multi-Family will be successfully incorporated into the existing and future roadway network. Analysis of the existing street network, the proposed project development, and expected traffic volumes resulted in the following conclusions and recommendations:

2024 Recommendations

- With buildout of the project, the west leg will be constructed at the intersection of 6th Avenue and Gun Club Road and will provide access to the project. The eastbound exiting approach of this intersection should provide two egress lanes with a 50-foot eastbound left turn lane and a shared through/right turn lane. It is recommended that a R1-1 “STOP” sign be installed by the project at the eastbound approach of the 6th Avenue and Gun Club Road intersection. A northbound and southbound left turn lane and a southbound right turn lane should be implemented at the 6th Avenue and Gun Club Road intersection. The northbound left turn lane and southbound right turn lane should be constructed by the project, whereas the southbound left turn lane is anticipated to be constructed by Cross Creek. These northbound left and southbound right turn lanes should provide 50 feet of length. The southbound left turn lane should provide a length of 75 feet. The existing southbound left turn volumes warrant a turn lane with City of Aurora standards.
- It is anticipated that the proposed adjacent development to the south, Lamar Landing Subdivision, will be built out prior to the project and will construct the west leg and a northbound left turn lane at the 5th Avenue and Gun Club Road intersection. The intersection of 5th Avenue and Gun Club Road is anticipated to meet four-hour vehicular volume warrants in 2024; therefore, signalization is anticipated to be appropriate control at this intersection by 2024. If signalized, the eastbound and westbound approaches of this intersection should provide 75-foot designated left turn lanes and a shared through/right turn lane, and the northbound approach should consist of a 50-foot designated left turn lane and a shared through/right turn lane. It should be noted that signalization is triggered by traffic volumes on the east leg of this intersection; therefore, it is believed that westbound left turn lane and signalization will be constructed in association with the development of Cross Creek.
- It is recommended that the eastbound left turn lane at the 6th Parkway and Gun Club Road intersection be extended to 225 feet. A southbound right turn should be constructed with a

length of 50 feet at this intersection. These turn lane improvements are anticipated with development of the Lamar Landing project.

2045 Recommendations

- By 2045, the City of Aurora six-lane cross section is expected to be provided by others along 6th Parkway within the project limits. Further, Gun Club Road is expected to be constructed by others to the ultimate street section of two through lanes in each direction.
- The intersection of 6th Avenue and Gun Club Road is anticipated to meet four-hour vehicular volume warrants in 2045; therefore, signalization may be needed by 2045 which is consistent with the Aurora Crossroads study. If signalized, the westbound approaches of this intersection should provide a designated left turn lane. It should be noted that signalization is triggered by traffic volumes on the east leg of this intersection; therefore, it is believed that westbound left turn lane and signalization will be constructed in association with the development of Cross Creek.
- Eastbound and westbound dual left turn lanes and an eastbound right turn lane may be needed at the 6th Parkway and Gun Club Road intersection by 2045. It should be noted that these improvements are consistent with the findings in the Aurora Crossroads study and should be provided as a background improvement.
- By 2045, the intersection of Colfax Avenue and I-70 Frontage Road is anticipated to be realigned so that Colfax Avenue extends east-west, and the I-70 Frontage Road extend north-south. With this realignment, the eastbound approach should consist of a left turn lane and two through lanes while the westbound approach should include two through lanes with the outside lane being a shared through/right turn lane. The southbound approach should be stop-controlled with a R1-1 STOP sign and provide separate left and right turn lanes. Of note, these improvements are consistent with the findings in the Aurora Crossroads study and should be provided as a background improvement.

General Recommendations:

- Any on-site and off-site roadway, signing, striping, and signal improvements should be incorporated into the Civil Drawings, and conform to City of Aurora standards as well as the Manual on Uniform Traffic Control Devices – 2009 Edition (MUTCD).

2.0 INTRODUCTION

Kimley-Horn and Associates, Inc. has prepared this report to document the results of the Traffic Study for the proposed Vista Creek Multi-Family project to be located on the southwest corner of the 6th Avenue and Gun Club Road intersection in Aurora, Colorado. A vicinity map illustrating the Vista Creek Multi-Family development area site Aurora is shown in **Figure 1**. For the purposes of this analysis, Vista Creek Multi-Family is anticipated to include 321 multifamily dwelling units. A conceptual land use plan is attached in **Figure 2**. It is expected that Vista Creek Multi-Family will be completed in the next several years; therefore, analysis was conducted for the 2024 short term horizon as well as the 2045 long-term horizon.

The purpose of this traffic study is to identify project traffic generation characteristics and potential project traffic related impacts on the local street system, as well as to develop mitigation measures required for identified impacts. The following intersections were incorporated into this traffic study in accordance with City of Aurora standards and requirements:

- 6th Avenue and Gun Club Road
- 5th Avenue and Gun Club Road
- 6th Parkway and Gun Club Road
- Colfax Avenue and Gun Club Road/I-70 Frontage Road

Regional access to Vista Creek Multi-Family will be provided by Interstate 70 (I-70), E-470, and Interstate 225 (I-225). Primary access to the project is provided by 6th Parkway and Gun Club Road. Direct access is proposed from the future west legs of 5th Avenue and 6th Avenue at Gun Club Road.

3.0 EXISTING AND FUTURE CONDITIONS

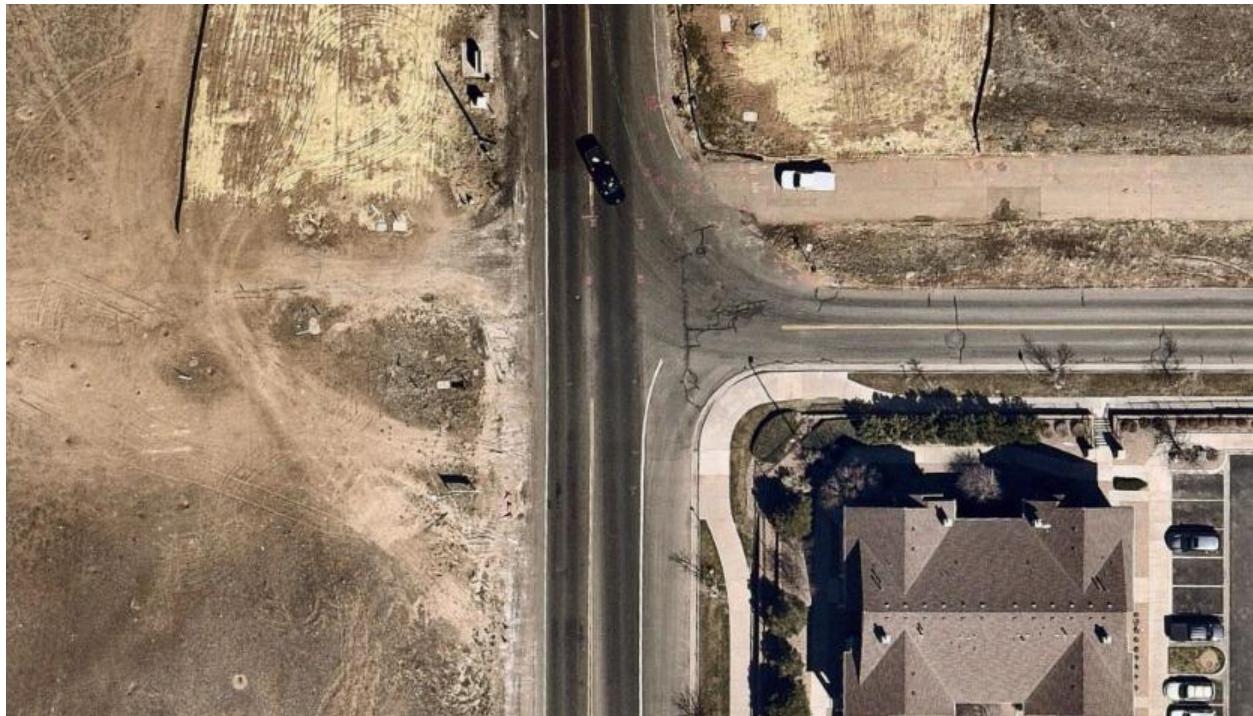

3.1 Existing Study Area/Site Visit

The existing site is comprised of vacant land. The project location is mainly surrounded by vacant land with some residential housing to the east. To the south is the proposed Lamar Landing Subdivision and directly to the east are multifamily homes. The project site backs up to E-470 to the west. Buckley Air Force Base is located in the extended area west of the project.

3.2 Existing Roadway Network

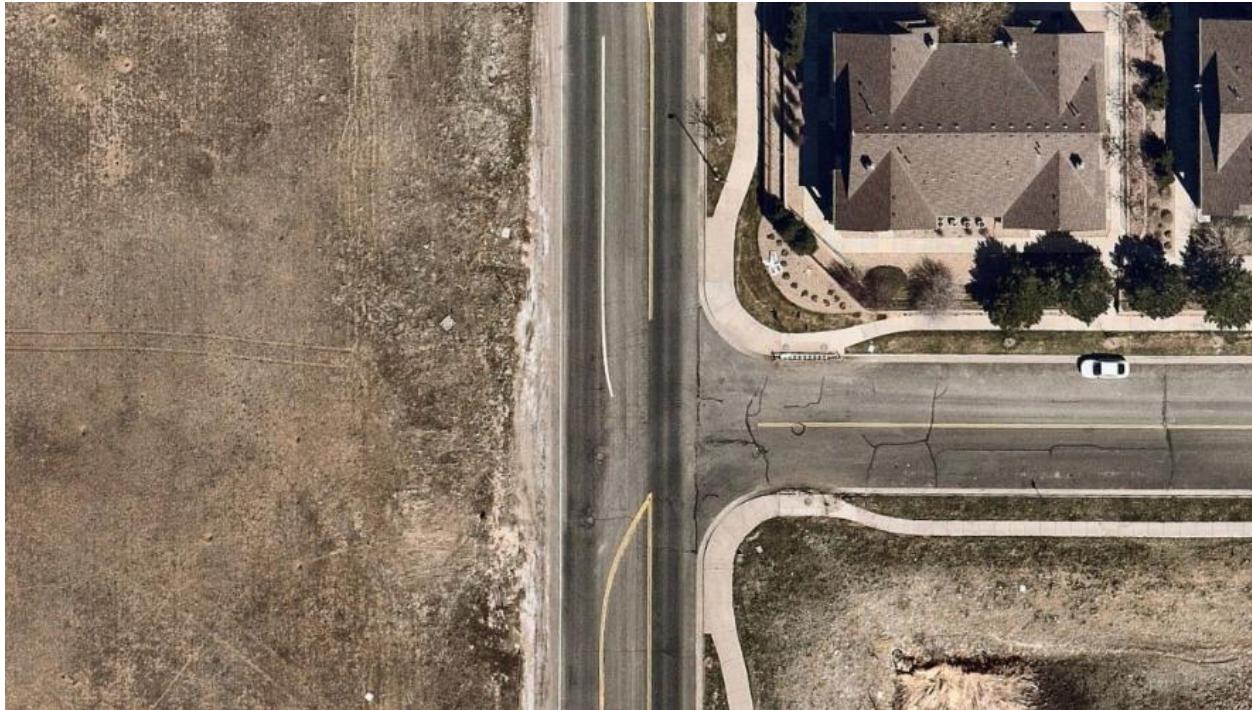

6th Parkway provides one through lane eastbound and westbound with a 45 mile per hour posted speed. Gun Club Road provides one lane of travel in each direction, northbound and southbound, with a speed limit of 45 miles per hour. 6th Parkway and Gun Club Road both provide a striped centerline and a left turn lane at 5th Avenue along Gun Club Road. The east leg of 6th Parkway at Gun Club Road provides a raised median and is built to the ultimate configuration of three through lanes in each direction. 5th Avenue and 6th Avenue both are collector streets extending eastbound and westbound with one through lane of travel in each direction.

6th Avenue and Gun Club Road is a three-leg stop controlled intersection, with a stop sign on the westbound approach. The westbound and southbound approaches consist of a single lane for all available movements. The northbound approach consists of a right turn lane and a through lane. An aerial photo of the existing intersection configuration is below (north is up - typical).

6th Avenue & Gun Club Road

5th Avenue and Gun Club Road is a three-leg stop-controlled intersection, with a stop sign on the westbound approach. The westbound and northbound approaches consist of a single lane for all available movements. The southbound approach consists of a left turn lane and a through lane. An aerial photo of the existing intersection configuration is below (typ.).

5th Avenue & Gun Club Road

The 6th Parkway and Gun Club Road intersection is a four-leg signalized intersection. The westbound and northbound approaches consist of a left turn lane, a through lane, and a right turn lane. The eastbound and southbound approach consists of a left turn lane and a shared through/right turn lane. According to the October 2018 Northeast Area Transportation Study Refresh, 6th Parkway is planned to be a 6-lane roadway and Gun Club Road is planned to be a 4-lane roadway by 2040. An aerial photo of the existing intersection configuration is below (typ.).

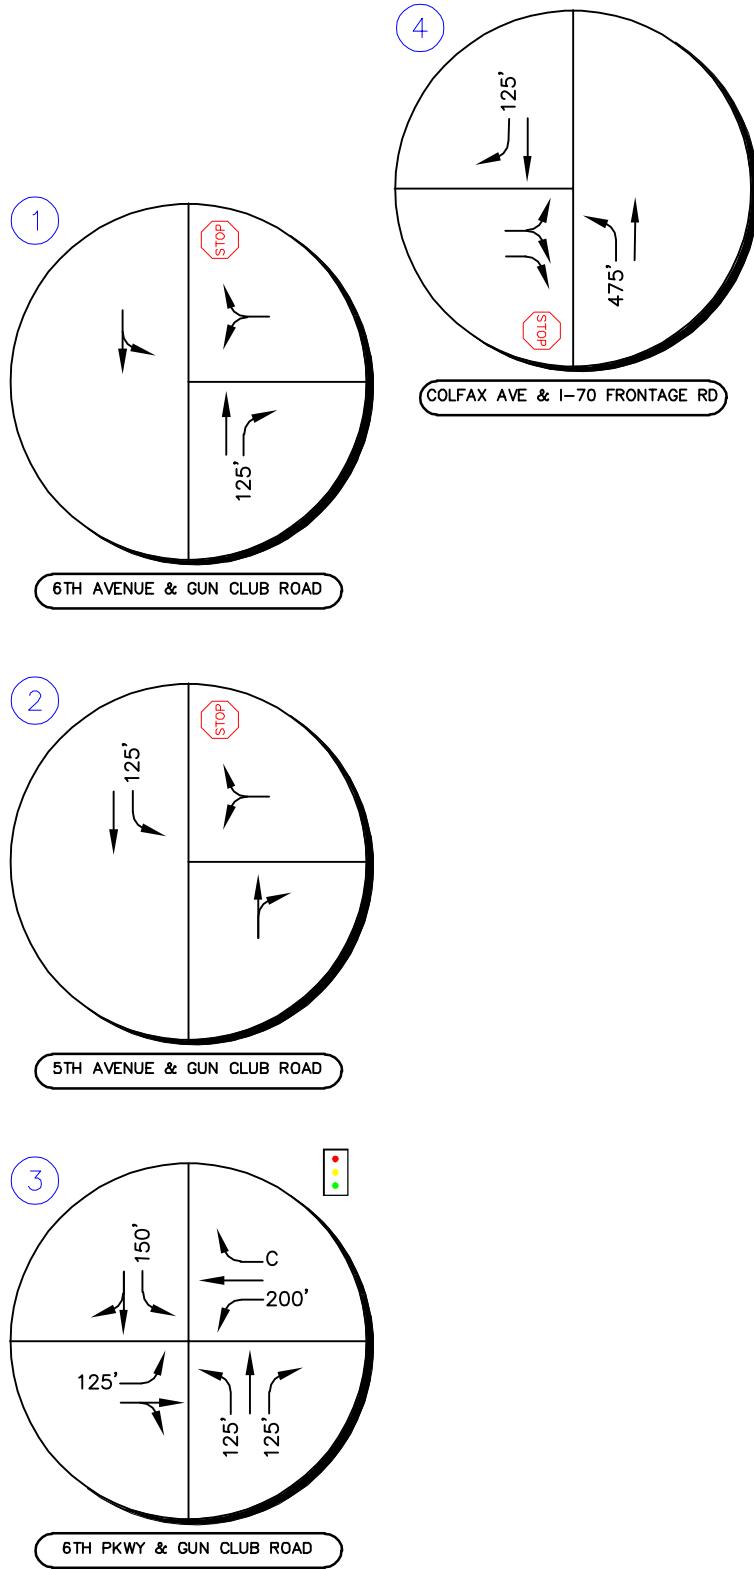

6th Parkway & Gun Club Road

Colfax Avenue and Gun Club Road/I-70 Frontage Road is a three-leg stop-controlled intersection, with a stop sign on the eastbound approach. The eastbound approach consists of a shared left turn/right turn lane and a right turn lane. The northbound approach consists of a left turn lane and a through lane while the southbound approach includes a through lane and a right turn lane. An aerial photo of the existing intersection configuration is below (typ.).

Colfax Avenue & Gun Club Road/I-70 Frontage Road

The intersection lane configuration and control for the study area key intersections are shown in **Figure 3**.

EXISTING GEOMETRY AND CONTROL

FIGURE 3

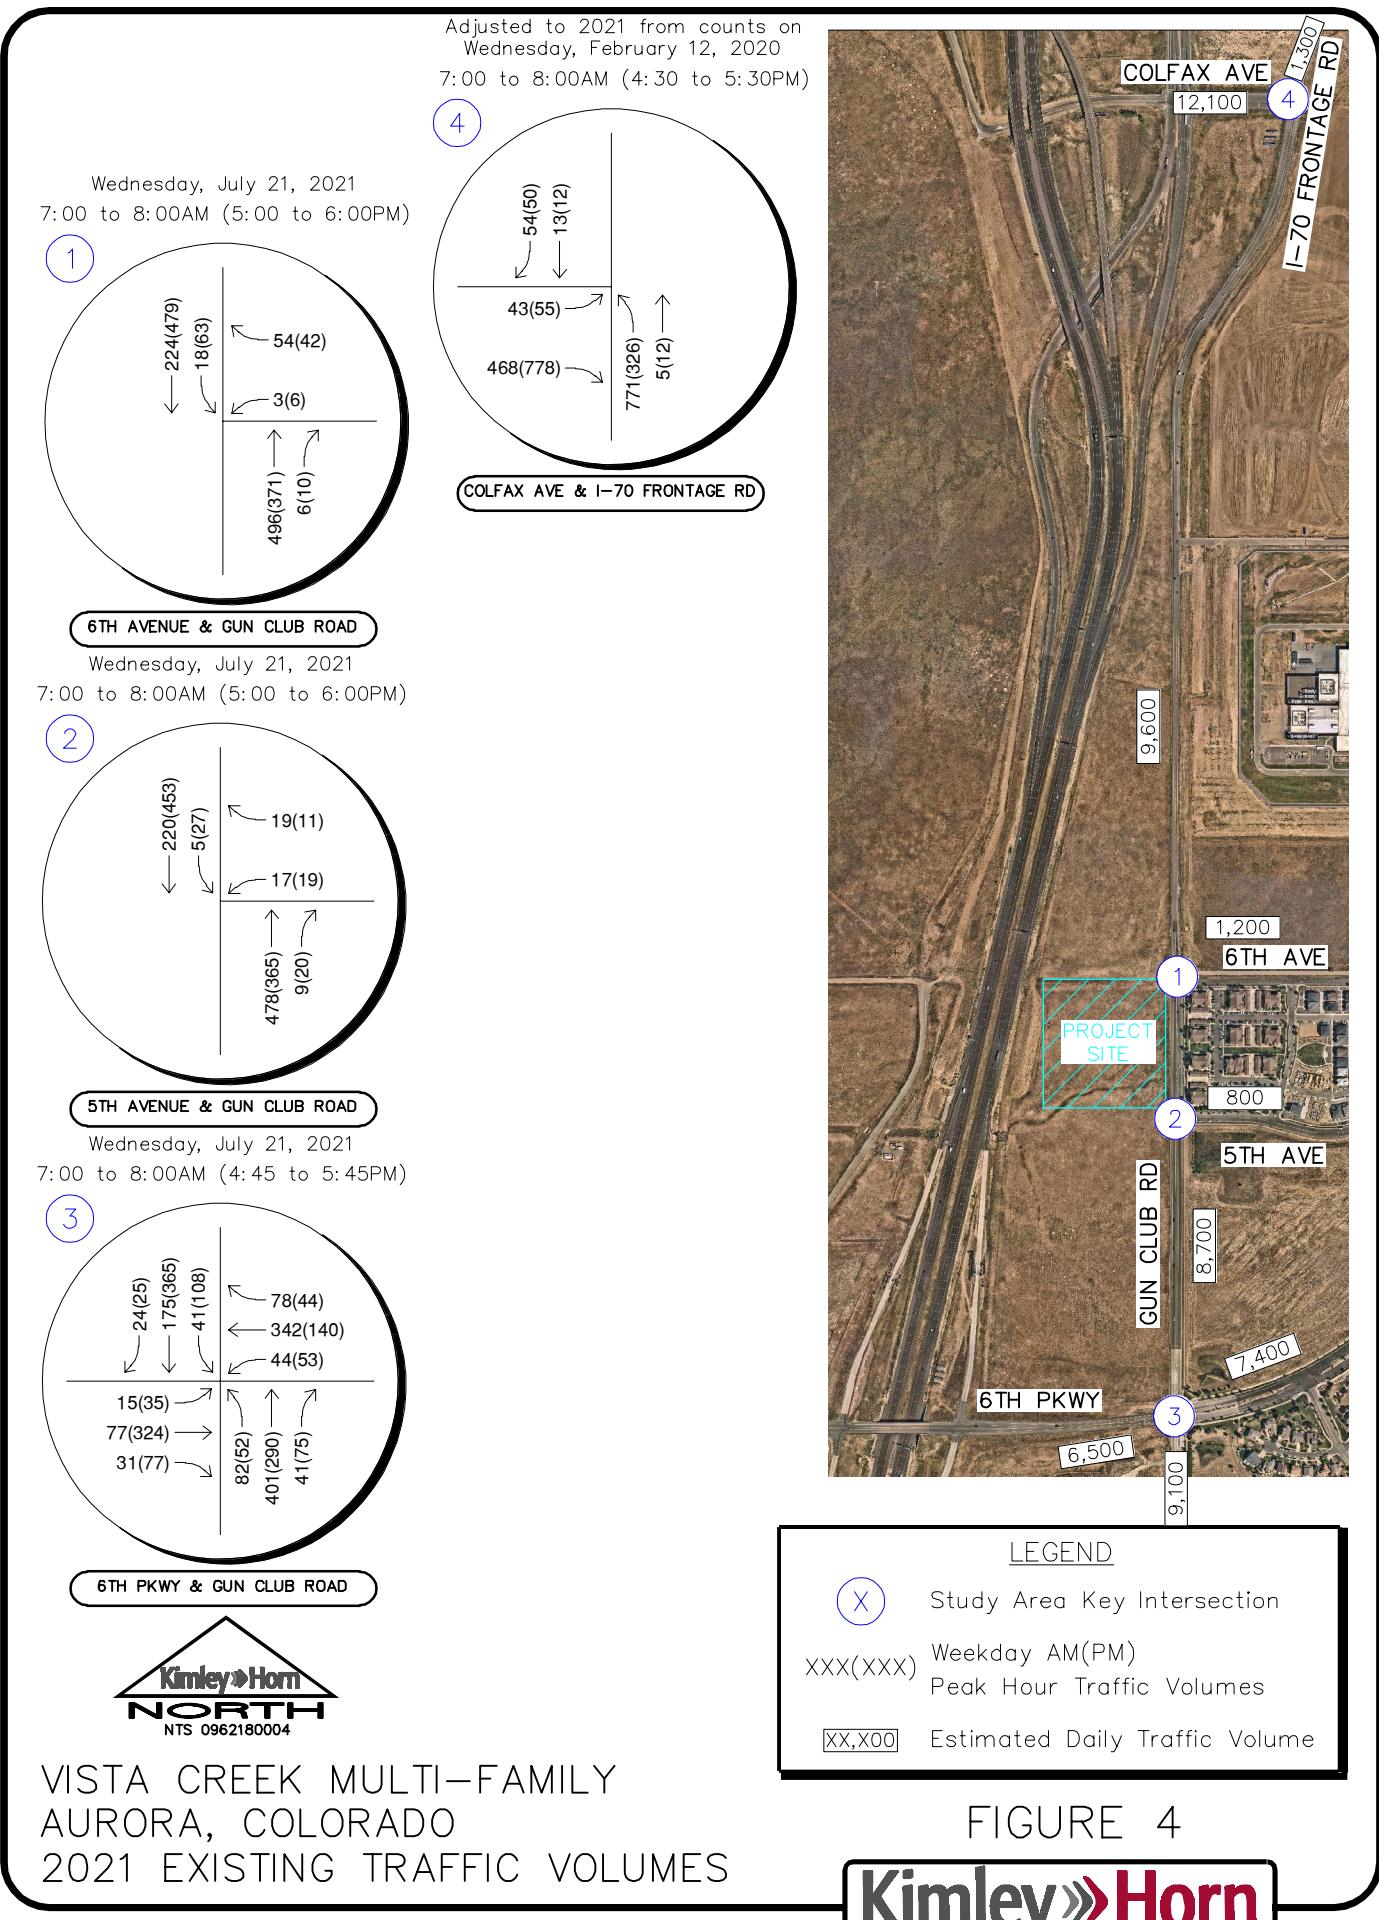

3.3 Existing Traffic Volumes

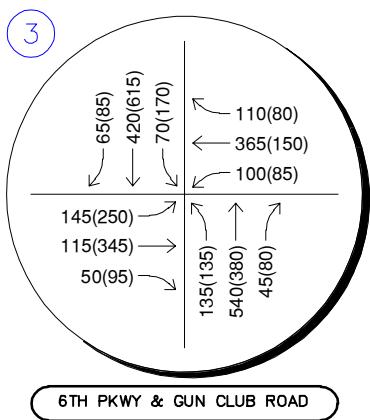

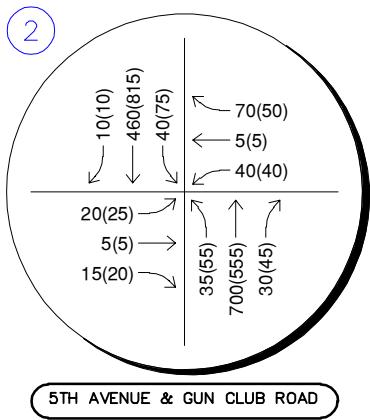

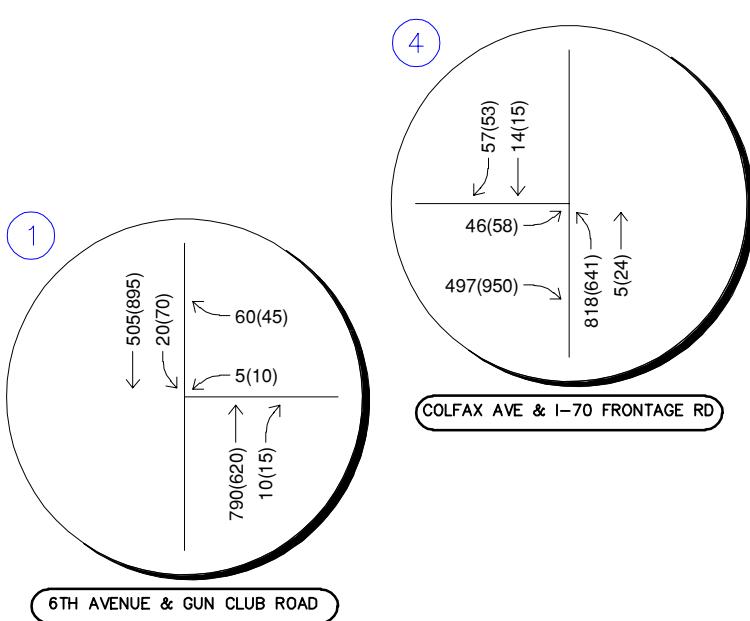

Existing turning movement counts were conducted at the study intersections on Wednesday, July 21, 2021, during the morning and afternoon peak hours with the exception of the counts at the intersection of Colfax Avenue and Gun Club Road/I-70 Frontage Road which were collected on Wednesday, February 12, 2020. These counts were grown to 2021 using the City of Aurora requirement of a two (2) percent annual growth rate. Counts were conducted in 15-minute intervals during the morning and afternoon peak hours of adjacent street traffic from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM on this count date. The existing intersection traffic volumes are shown in **Figure 4** with count sheets provided in **Appendix A**.

3.4 Unspecified Development Traffic Growth

To generate 2024 background volumes, the 2022 total traffic volumes from the *Lamar Landing Subdivision Traffic Impact Study* completed by Kimley-Horn & Associates in September 2020 were grown using a two (2) percent annual growth rate per the City of Aurora growth requirement to 2024. The traffic volumes from the Lamar Landing study included site traffic volumes from the E-470 and 6th Parkway FDP and Cross Creek projects. The City of Aurora standard annual growth rate of two (2) percent was applied at the intersection of 6th Avenue and Gun Club Road while increasing the northbound and southbound through volumes to balance with the traffic volumes from the Lamar Landing traffic study.

As directed by the City of Aurora, traffic volumes were derived from 2040 traffic volume projections within the Northeast Area Transportation Study Refresh (NEATS Refresh). This was due to recent changes in the Aurora Crossroads development and to reduce travel volumes along Gun Club Road. The reduction of traffic volumes along Gun Club Road is expected with travel pattern changes associated with 6th Parkway being extended further to the east and additional interchange connections being provided along I-70 to the northeast in the future. Neither of these infrastructure changes to 6th Parkway and I-70 will occur by 2024; therefore, traffic volumes in 2024 were not modified to account for the addition of future roadways in the surrounding area. It is believed that travel patterns will shift with the future extension of 6th Parkway to the east and additional interchange access to I-70 to the northeast (consistent with findings in NEATS). Applicable traffic study documents from the Lamar Landing Subdivision, Cross Creek, E-470 and 6th Pkwy FDP, and Aurora Crossroads developments are included in **Appendix B**. Background traffic volumes for 2024 and 2045 are shown in **Figures 5** and **6**, respectively.

FIGURE 5

4.0 PROJECT TRAFFIC CHARACTERISTICS

4.1 Trip Generation

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land use to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation rates is the *Trip Generation Manual*¹ published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses. For this study, Kimley-Horn used the ITE Trip Generation Report fitted curve equations that applies to Multifamily Mid-Rise Housing (ITE Land Use Code 221), for traffic associated with the development.

Vista Creek Multi-Family is expected to generate approximately 1,748 weekday daily trips, with 107 of these trips occurring during the morning peak hour and 136 of these trips occurring during the afternoon peak hour. Calculations were based on the procedure and information provided in the ITE *Trip Generation Manual, 10th Edition – Volume 1: User's Guide and Handbook*, 2017.

Table 1 summarizes the estimated trip generation for the Vista Creek Multi-Family. It should be noted that the City of Aurora requested that average trip rates also be provided in addition to the fitted curve equations and these rates are also shown in **Table 1**. ITE Trip Generation provides a flow chart to determine when average rates and fitted curve equations should be used, and the fitted curve equations were appropriately utilized in this study. The trip generation worksheets are included in **Appendix C**.

Table 1 – Vista Creek Multi-Family Traffic Generation

Land Use and Size	Rate	Daily	Weekday Vehicle Trips							
			AM Peak Hour				PM Peak Hour			
			Rate	In	Out	Total	Rate	In	Out	Total
Fitted Curve Equations (Used in Analysis) Multifamily Mid-Rise Housing (ITE 221) – 321 Dwelling Units	-	1,748	-	28	79	107	-	83	53	136
Average Rates Multifamily Mid-Rise Housing (ITE 221) – 321 Dwelling Units	5.44	1,746	0.36	30	86	116	0.44	86	55	141

¹ Institute of Transportation Engineers, *Trip Generation Manual*, Tenth Edition, Washington DC, 2017.

4.2 Trip Distribution

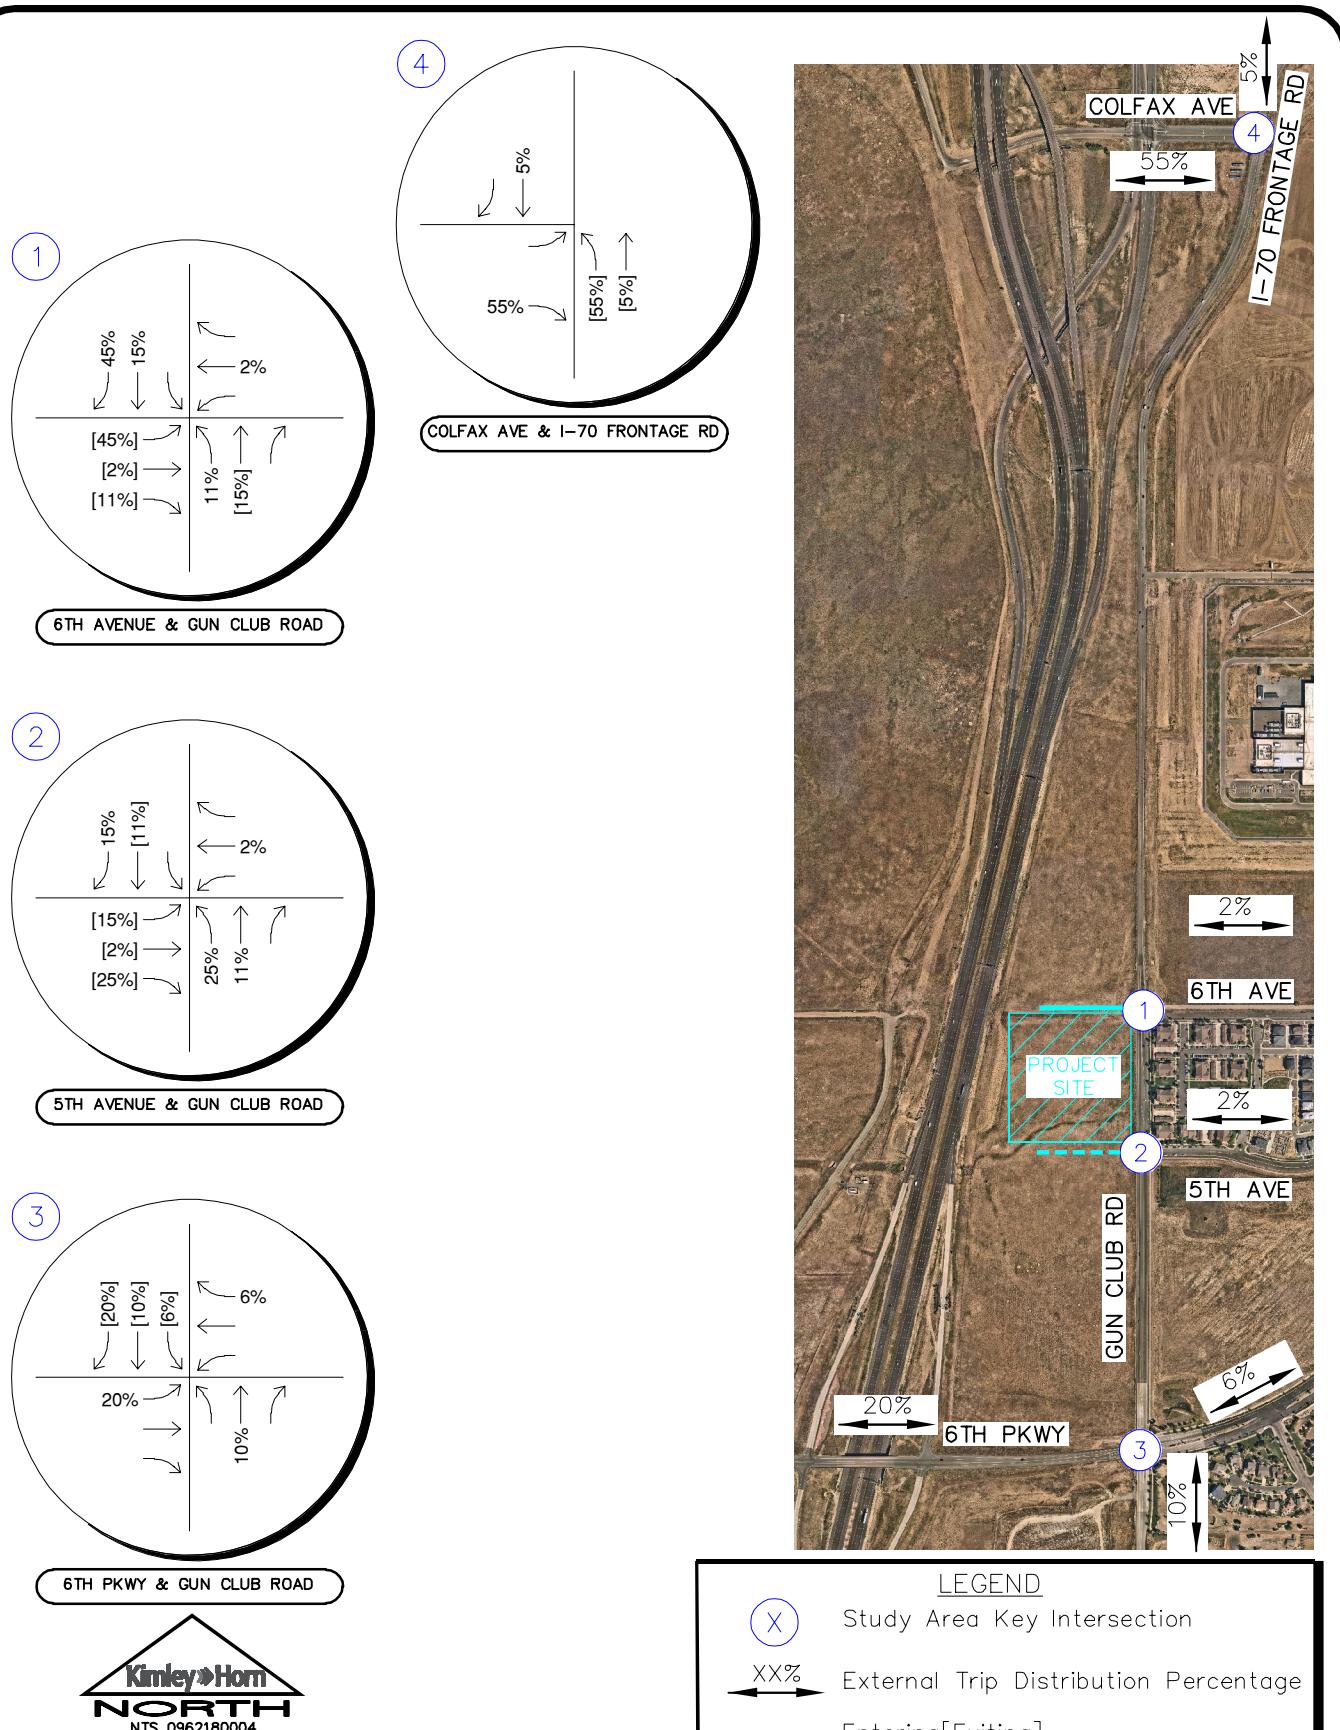

Distribution of site traffic on the street system was based on the area street system characteristics, existing traffic patterns, existing and anticipated surrounding demographic information, and the proposed access system for the project. The directional distribution of traffic is a means to quantify the percentage of site-generated traffic that approaches the site from a given direction and departs the site back to the original source. Two project distributions were provided due to the proposed future realignment of the intersection of Colfax Avenue and I-70 Frontage Road/Gun Club Road. The project trip distribution for the proposed development is illustrated in **Figure 7** for the 2024 horizon and **Figure 8** for the 2045 horizon.

4.3 Traffic Assignment

Vista Creek Multi-Family traffic assignment was obtained by applying the project trip distribution to the estimated traffic generation of the development shown in **Table 1**. Traffic assignment for the proposed project is shown in **Figure 9** for the 2024 horizon and **Figure 10** for the 2045 horizon.

4.4 Total (Background Plus Project) Traffic

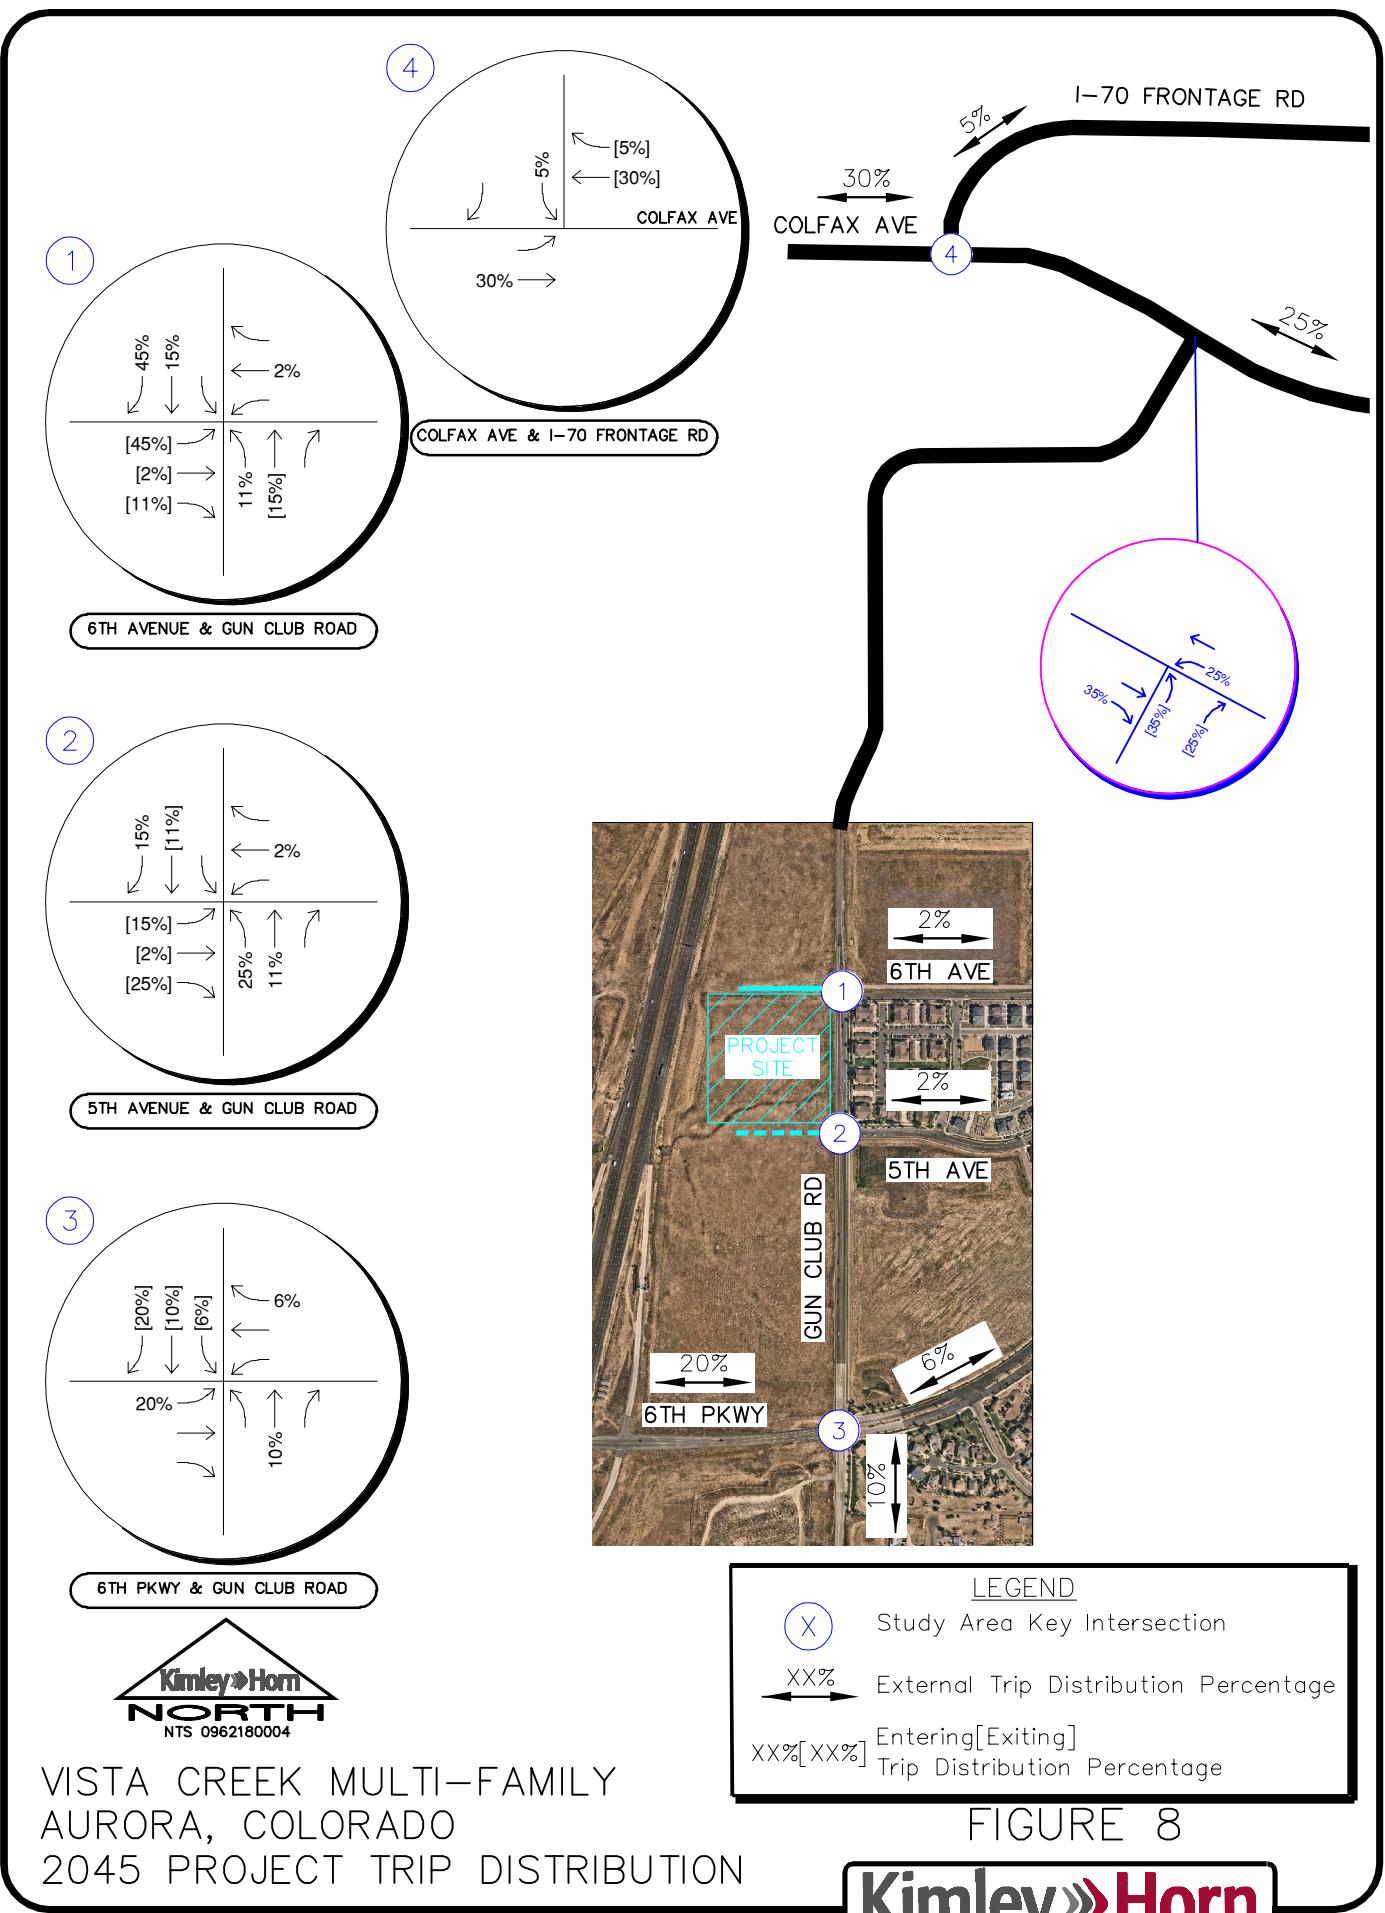

Site traffic volumes were added to the background volumes to represent estimated traffic conditions for the short-term 2024 buildout horizon and long-term 2045 twenty-year planning horizon. These total traffic volumes for the study area are illustrated for the 2024 and 2045 horizon years in **Figures 11** and **12**, respectively.

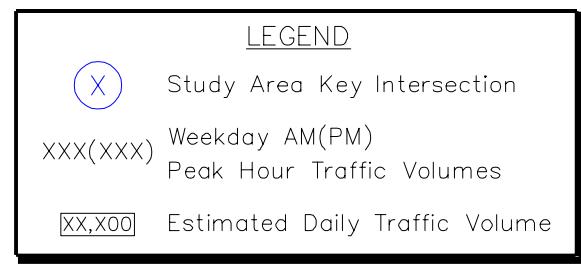

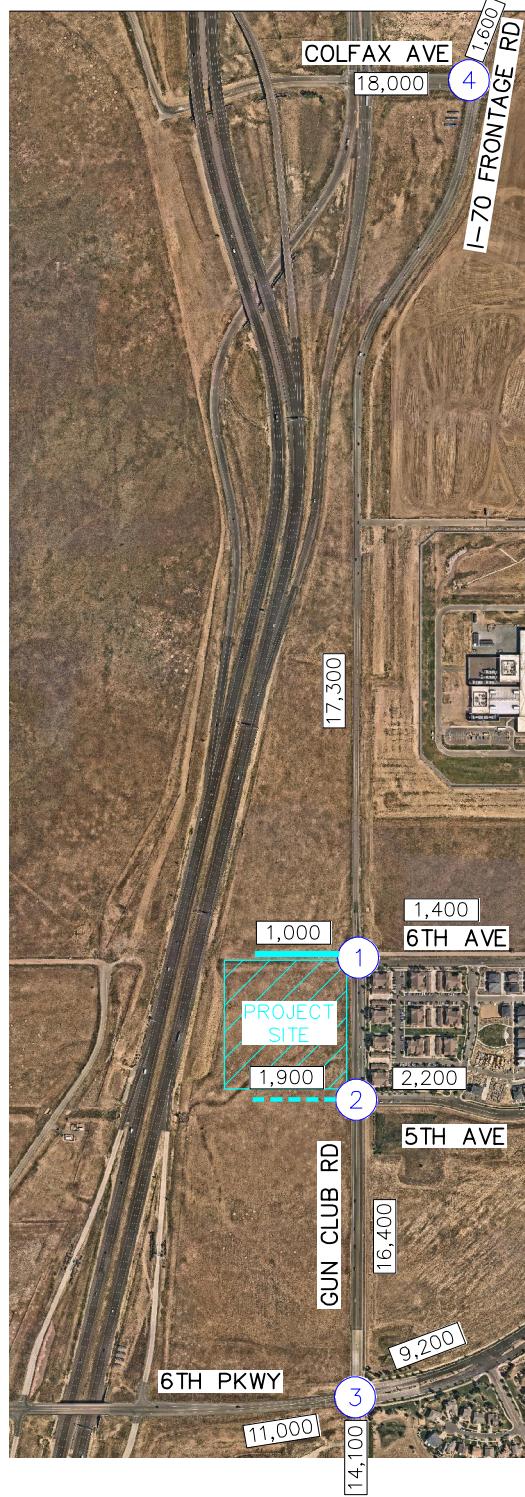

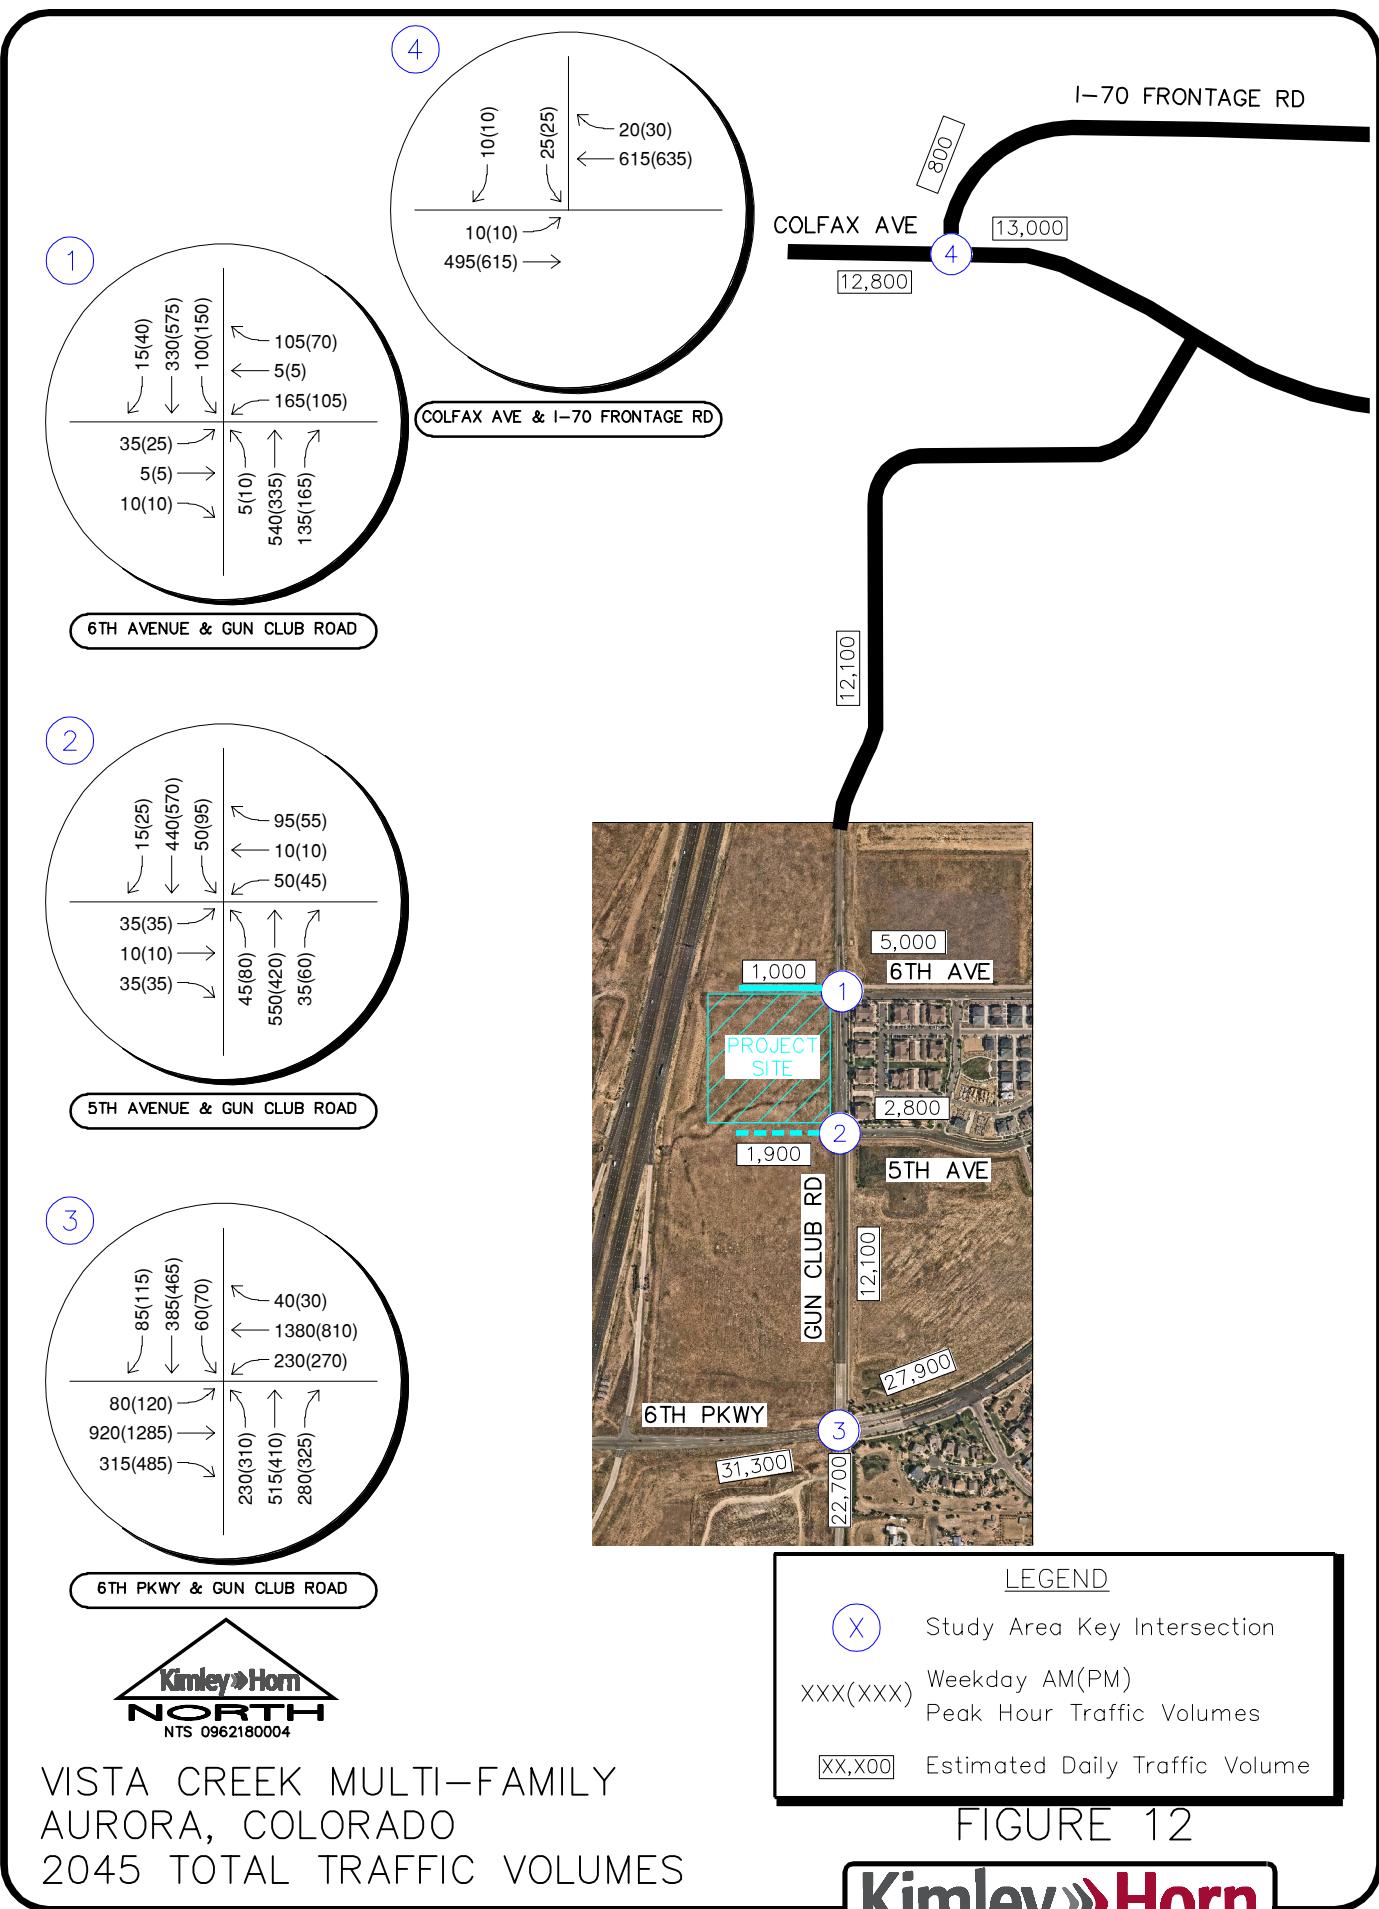

FIGURE 11

5.0 TRAFFIC OPERATIONS ANALYSIS

Kimley-Horn's analysis of traffic operations in the site vicinity was conducted to determine potential capacity deficiencies in the 2024 and 2045 development horizons at the identified key intersections. The acknowledged source for determining overall capacity is the current edition of the *Highway Capacity Manual (HCM)*².

5.1 Analysis Methodology

Capacity analysis results are listed in terms of Level of Service (LOS). LOS is a qualitative term describing operating conditions a driver will experience while traveling on a particular street or highway during a specific time interval. It ranges from A (very little delay) to F (long delays and congestion). According to City of Aurora guidelines for signalized intersections, individual movements may be allowed to fall to LOS E, but in most cases the overall intersection must operate (or be projected to operate) at a LOS D or better during AM and PM peak periods. If the existing LOS for an intersection is less than LOS D, potential alternatives to improve the intersection should be provided to achieve LOS D or maintain the existing critical lane volume with the addition of site generated traffic. Minor movements at unsignalized intersections, such as left turns onto a major arterial from a side street, may be allowed to fall below LOS D pending the specific conditions. Movements which have a light traffic demand, and a viable travel alternative may be allowed to fall below LOS D. **Table 2** shows the definition of level of service for signalized and unsignalized intersections.

Table 2 – Level of Service Definitions

Level of Service	Signalized Intersection Average Total Delay (sec/veh)	Unsignalized Intersection Average Total Delay (sec/veh)
A	≤ 10	≤ 10
B	$> 10 \text{ and } \leq 20$	$> 10 \text{ and } \leq 15$
C	$> 20 \text{ and } \leq 35$	$> 15 \text{ and } \leq 25$
D	$> 35 \text{ and } \leq 55$	$> 25 \text{ and } \leq 35$
E	$> 55 \text{ and } \leq 80$	$> 35 \text{ and } \leq 50$
F	> 80	> 50

Definitions provided from the Highway Capacity Manual, Sixth Edition, Transportation Research Board, 2016.

² Transportation Research Board, *Highway Capacity Manual*, Sixth Edition, Washington DC, 2016.

Study area intersections were analyzed based on average total delay analysis for signalized and unsignalized intersections. Under the unsignalized analysis, the LOS for a two-way stop-controlled intersection is determined by the computed or measured control delay and is defined for each minor movement. LOS for a two-way stop-controlled intersection is not defined for the intersection as a whole. LOS for signalized, roundabout, and four-way stop controlled intersections are defined for each approach and for the overall intersection.

5.2 Key Intersection Operational Analysis

Calculations for the operational level of service at the key intersections for the study area are provided in **Appendix D**. The existing year analysis is based on the lane geometry and intersection control shown in **Figure 3**. Existing peak hour factors were utilized in the existing and 2024 horizon analysis years while the HCM urban standard of 0.92 was used for the long-term 2045 horizon analysis. The signalized intersection analysis utilizes the observed cycle lengths with optimized phasing and timing. Based on increased national attention given to establishing appropriate yellow and all-red clearance intervals to improve intersection safety, these have been calculated and are applied for approaches at the signalized intersections. The increase in yellow and all red time sacrifices intersection capacity for improved safety. Synchro traffic analysis software was used to analyze the signalized, and unsignalized key intersections for HCM level of service.

6th Avenue and Gun Club Road

6th Avenue and Gun Club Road is a three-leg stop controlled intersection, with a stop sign on the westbound approach. The intersection movements operate acceptably at LOS B or better during both peak hours under existing conditions. With completion of the development, a west leg is proposed to align with 6th Avenue to create a full movement access that will be constructed by Vista Creek. It is recommended that Vista Creek install a R1-1 “STOP” sign at the eastbound approach and designate an eastbound left turn lane, a northbound left turn lane, and a southbound right turn lane for entering and exiting the development. Of note, a southbound left turn lane, to be constructed by Cross Creek, is warranted for the developments east of Gun Club Road and has been included in the background and total scenario analyses. With these improvements, the movements at this intersection are anticipated to operate at LOS D or better throughout 2024.

By 2045, Gun Club Road is expected to be constructed by others to the ultimate street section of two through lanes in each direction and a northbound right turn lane. A four-hour signal warrant evaluation was conducted at this intersection, and it was determined that a signal is anticipated to be warranted with 2045 background traffic projections, due to the traffic on the east leg from the Cross Creek development. Signal warrant analysis worksheets are included in **Appendix F**. Therefore, signalization may be needed and be constructed by Cross Creek by 2045 which is consistent with the Aurora Crossroads study. If signalized, the westbound approach of this intersection should provide a designated left turn lane to be constructed by Cross Creek. With these improvements the intersection is anticipated to operate acceptably overall throughout 2045. However, some movements are anticipated at LOS E which is typical due to the 120 second cycle length and the time needed to trigger green from the minor approaches, as well as the low duration of green time provided on the minor approach.

Although a northbound right turn lane is expected to be warranted at this intersection by 2045 based on traffic volume projections, the City of Aurora has requested an additional 2045 alternative analysis without a northbound right turn lane due to geometric constraints. It should be noted that project traffic does not contribute to the northbound right turn movement at this intersection. However, through additional design coordination with the City of Aurora, a northbound right turn lane has been recommended at this intersection. **Table 3** provides the results of the LOS analysis conducted at this intersection.

5th Avenue and Gun Club Road

5th Avenue and Gun Club Road is a three-leg stop controlled intersection with a stop sign on the westbound approach. The intersection movements operate acceptably at LOS B or better during both peak hours under existing conditions. The west leg of this intersection will be constructed with the Lamar Landing Subdivision development along with a northbound left turn lane. With stop control along the eastbound and westbound approaches of this intersection, the westbound approach is expected to operate with LOS F during the afternoon peak hour in 2024. As such, a four-hour signal warrant evaluation was conducted at this intersection, and it was determined that a signal is anticipated to be warranted with 2024 total traffic projections and in the future with 2045 background traffic projections. Signal warrant analysis worksheets are included in **Appendix F**. It should be noted that signalization is triggered on the east leg of this intersection with adjacent development traffic volumes and therefore the signal should be installed with development of Cross Creek. With signalization, implementation of an eastbound and westbound left turn lane is recommended to avoid split phasing the intersection and to avoid left turn movements blocking through movements. The eastbound left turn lane will be constructed with development of Lamar Landing, whereas the westbound left turn lane should be constructed by Cross Creek. With these improvements, this intersection is expected to operate acceptably with LOS B during both peak hours 2024.

By 2045, Gun Club Road is expected to be constructed by others to the ultimate street section of two through lanes in each direction. With two through lanes in each direction along Gun Club Road and signalization, this intersection is anticipated to operate acceptably at LOS A during both peak hours in 2045. However, some movements are anticipated at LOS E which is typical due to the 120 second cycle length because of the low duration of green time provided on the minor approach. **Table 4** provides the results of the LOS analysis conducted at this intersection.

6th Parkway and Gun Club Road

The 6th Parkway and Gun Club Road intersection is a four-leg signalized intersection. This intersection currently operates at LOS C during the morning and afternoon peak hour. It should be noted a southbound right turn lane is planned to be constructed by Lamar Landing at the 6th Parkway and Gun Club Road intersection and was incorporated in the analysis starting in the 2024 background scenario. With the addition of the project traffic in 2024, the intersection is expected to operate at LOS C during the morning peak hour and LOS D during the afternoon peak hour.

By 2045, the City of Aurora ultimate cross sections of three eastbound and westbound through lanes, and two northbound and southbound through lanes should be provided at this intersection as background improvements. In addition, eastbound and westbound dual left turn lanes and an eastbound right turn lane may be needed at this intersection by 2045 as background improvements. It should be noted that these improvements are consistent with the findings in the Aurora Crossroads study. With these improvements by 2045, this intersection is anticipated to operate acceptably during the peak hours. However, some movements are anticipated at LOS E which is typical at signalized intersections. **Table 5** provides the results of the level of service at this intersection.

Colfax Avenue and Gun Club Road/I-70 Frontage Road

Colfax Avenue and Gun Club Road/I-70 Frontage Road is a three-leg stop-controlled intersection, with a stop sign on the eastbound approach. The shared eastbound left/right turn movements currently operate with LOS E during the morning peak and is anticipated to operate with LOS F, without project traffic, during the morning peak hour in 2024. However, this intersection is planned to be realigned, and it is recommended that realignment occur prior to any other improvements.

By 2045, this intersection is anticipated to be realigned so that Colfax Avenue extends east-west, and the I-70 Frontage Road extend north-south. With this realignment, the eastbound approach should consist of a left turn lane and two through lanes while the westbound approach should include two through lanes with the outside lane being a shared through/right turn lane as background improvements. The southbound approach should be stop-controlled with a R1-1 STOP sign and provide separate left and right turn lanes as background improvements. It should be noted that these improvements are consistent with the findings in the Aurora Crossroads study. With this configuration, the movements at this intersection are anticipated to operate acceptably throughout 2045 with the addition of project traffic. **Table 6** provides the results of the LOS analysis conducted at this intersection.

5.3 Turn Lane Requirements Analysis

The City of Aurora has directed Kimley-Horn to use the Colorado Department of Transportation (CDOT) State Highway Access Code (SHAC) guidelines to determine if turn lanes are warranted for access into the project accesses. CDOT classifies their state highways based on roadway types. The Non-Rural Arterial Category NR-B (moderate travel speeds and moderate to high volumes) was assigned to 6th Parkway based on matching the characteristics of the CDOT roadways. The Non-Rural Arterial Category NR-C (low to moderate travel speeds and moderate volumes) was assigned to Gun Club Road based on matching the characteristics of the CDOT roadways.

According to the State Highway Access Code for category NR-B and NR-C roadways with speed limits greater than 40 miles per hour, a left turn deceleration lane is required for any access with a projected peak hour left ingress turning volume of 10 vehicles per hour (vph). A right turn deceleration lane is required for any access with a projected peak hour right ingress turning volume of 25 vph.

Based on the 2024 traffic volume projections, turn lane requirements at the study area key intersections are as follows:

6th Avenue and Gun Club Road

- A northbound left turn lane is warranted for the Gun Club Road and 6th Avenue intersection based on projected 2024 background plus project traffic volumes being 10 northbound left turns during the peak hour and the threshold being 10 vph.
- A southbound left turn lane is warranted for the Gun Club Road and 6th Avenue intersection based on projected 2024 background traffic volumes being 70 southbound left turns during the peak hour and the threshold being 10 vph.
- A southbound right turn lane is warranted for the Gun Club Road and 6th Avenue intersection based on projected 2024 background plus project traffic volumes being 33 southbound right turns during the peak hour and the threshold being 25 vph.

5th Avenue and Gun Club Road

- A northbound left turn lane is warranted for the Gun Club Road and 5th Avenue intersection based on projected 2024 background traffic volumes being 55 northbound left turns during the peak hour and the threshold being 10 vph. Of note, the Lamar Landing Subdivision development will provide a northbound left turn lane with the buildup of their project in 2022. This improvement has been identified in the Lamar Landing traffic study.
- A southbound right turn lane is not warranted for the Gun Club Road and 5th Avenue intersection based on projected 2024 background plus project traffic volumes being 22 southbound right turns during the peak hour and the threshold being greater 25 vph.

6th Parkway and Gun Club Road

- An eastbound left turn lane exists and is warranted for the 6th Parkway and Gun Club Road intersection based on projected 2024 background traffic volumes being 250 eastbound left turns during the peak hour and the threshold being 10 vph. This improvement has been identified in the Lamar Landing traffic study.
- A westbound right turn lane exists and is warranted for the 6th Parkway and Gun Club Road intersection based on projected 2024 background traffic volumes being 110 westbound right turns during the peak hour and the threshold being 25 vph. This turn lane is currently a continuous lane and modifications to this turn lane are not recommended.

- A southbound left turn lane exists and is warranted for the 6th Parkway and Gun Club Road intersection based on projected 2024 background traffic volumes being 170 southbound left turns during the peak hour and the threshold being 10 vph.
- A southbound right turn lane is warranted for the 6th Parkway and Gun Club Road intersection based on projected 2024 background traffic volumes being 85 southbound right turns during the peak hour and the threshold being 25 vph. This improvement has been identified in the Lamar Landing traffic study.

5.4 Vehicle Queuing Analysis

A vehicle queuing analysis was conducted for the study area intersections. The queuing analysis was performed using Synchro presenting the results of the 95th percentile queue lengths. Results are shown in the following **Table 7** with calculations provided within the level of service operational sheets of **Appendix D** for unsignalized intersections and vehicle queuing analysis worksheets in **Appendix E** for signalized intersections.

Table 7 – Turn Lane Queuing Analysis Results

Intersection Turn Lane	Existing Turn Lane Length (feet)	2024 Calculated Queue (feet)	2024 Recommended Length (feet)	2045 Calculated Queue (feet)	2045 Recommended Length (feet)

	475'	150'	475'	-	DNE
	125'	25'	125'	25'	50'

DL = Dual Left Turn Lanes; DNE = Does Not Exist; C = Continuous Turn Lane, CDOT = CDOT SHAC; AC = Aurora Crossroads Recommendation

As shown in the queuing table, all vehicle queues are expected to be contained within the existing turn lanes in 2024 with the exception of the eastbound left turn movements at the 6th Parkway and Gun Club Road intersection. By 2024, it is recommended that the eastbound left turn lane at the 6th Parkway and Gun Club Road intersection be extended from 125 feet to 225

feet of length. Additionally, the southbound right turn lanes should be constructed to a length of 50 feet. This improvement is identified in the Lamar Landing traffic study.

In order to comply with CDOT access code requirements, the intersection of 6th Avenue and Gun Club Road should have a southbound right turn lane with the buildout of the project site. In addition, a northbound and southbound left turn lane should be constructed at the 6th Avenue and Gun Club Road intersection. The northbound left turn lane should be constructed by Vista Creek, whereas the southbound left turn lane is anticipated to be constructed by Cross Creek. In addition, northbound left lane will be constructed by Lamar Landing Subdivision project at the intersection of 5th Avenue and Gun Club Road. All turn lanes are recommended to provide a length of 50 feet with the exception of the southbound left turn lane which is recommended to be 75 feet. The eastbound left turn lane at the intersection of 6th Avenue and Gun Club Road is recommended to be designated to a length of 50 feet. The eastbound and westbound left turn lanes at the intersection of 5th Avenue and Gun Club Road are recommended to be designated to a length of 75 feet to accommodate 2045 queue demands.

Eastbound and westbound dual left turn lanes may be needed at the 6th Parkway and Gun Club Road intersection by 2045 and should be studied further as traffic volumes materialize in the future.

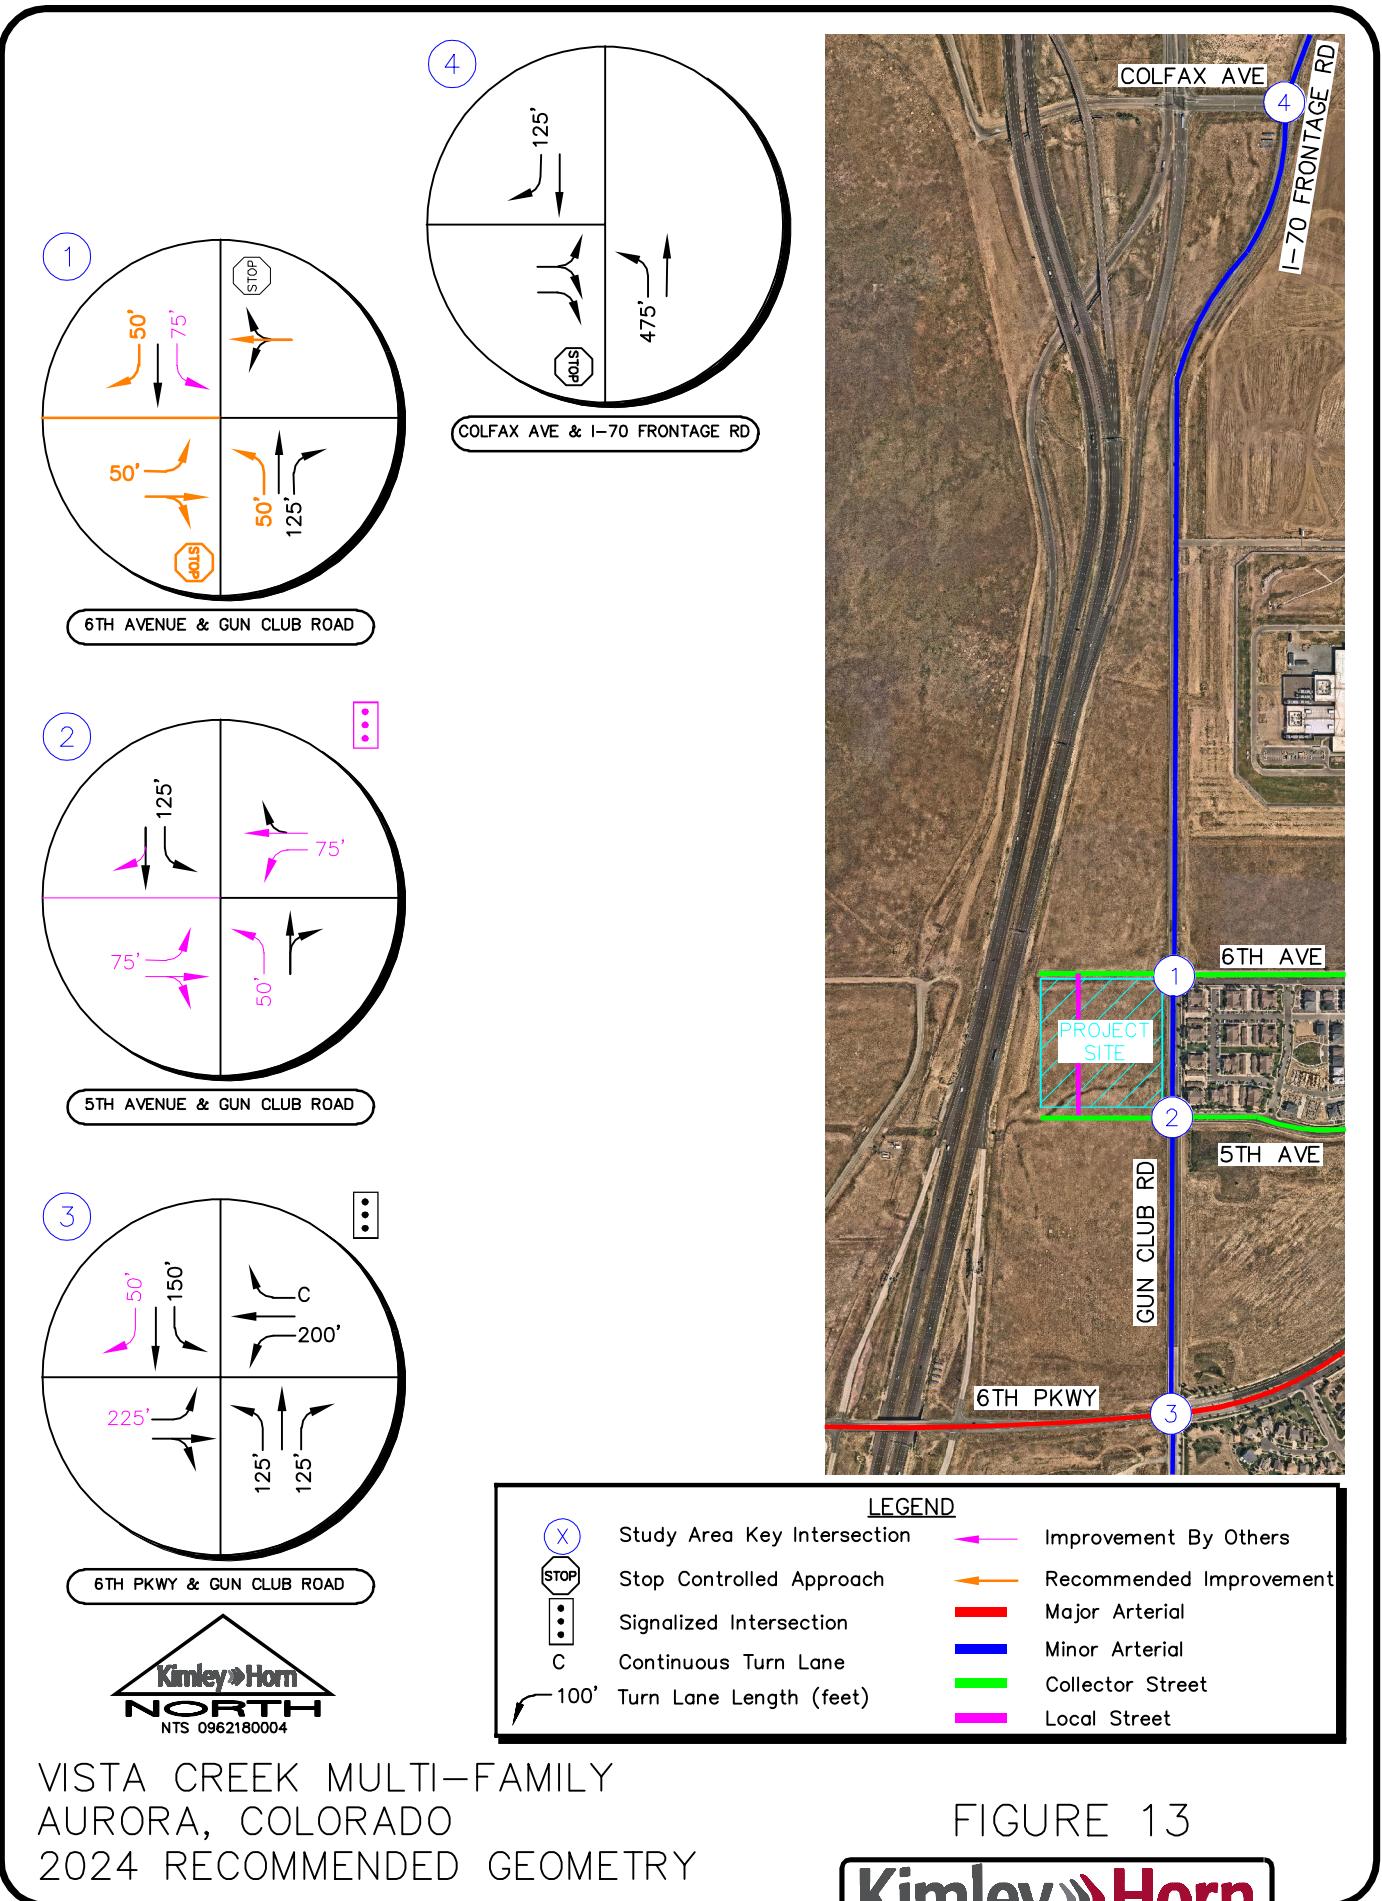

5.5 Multi-Modal Analysis

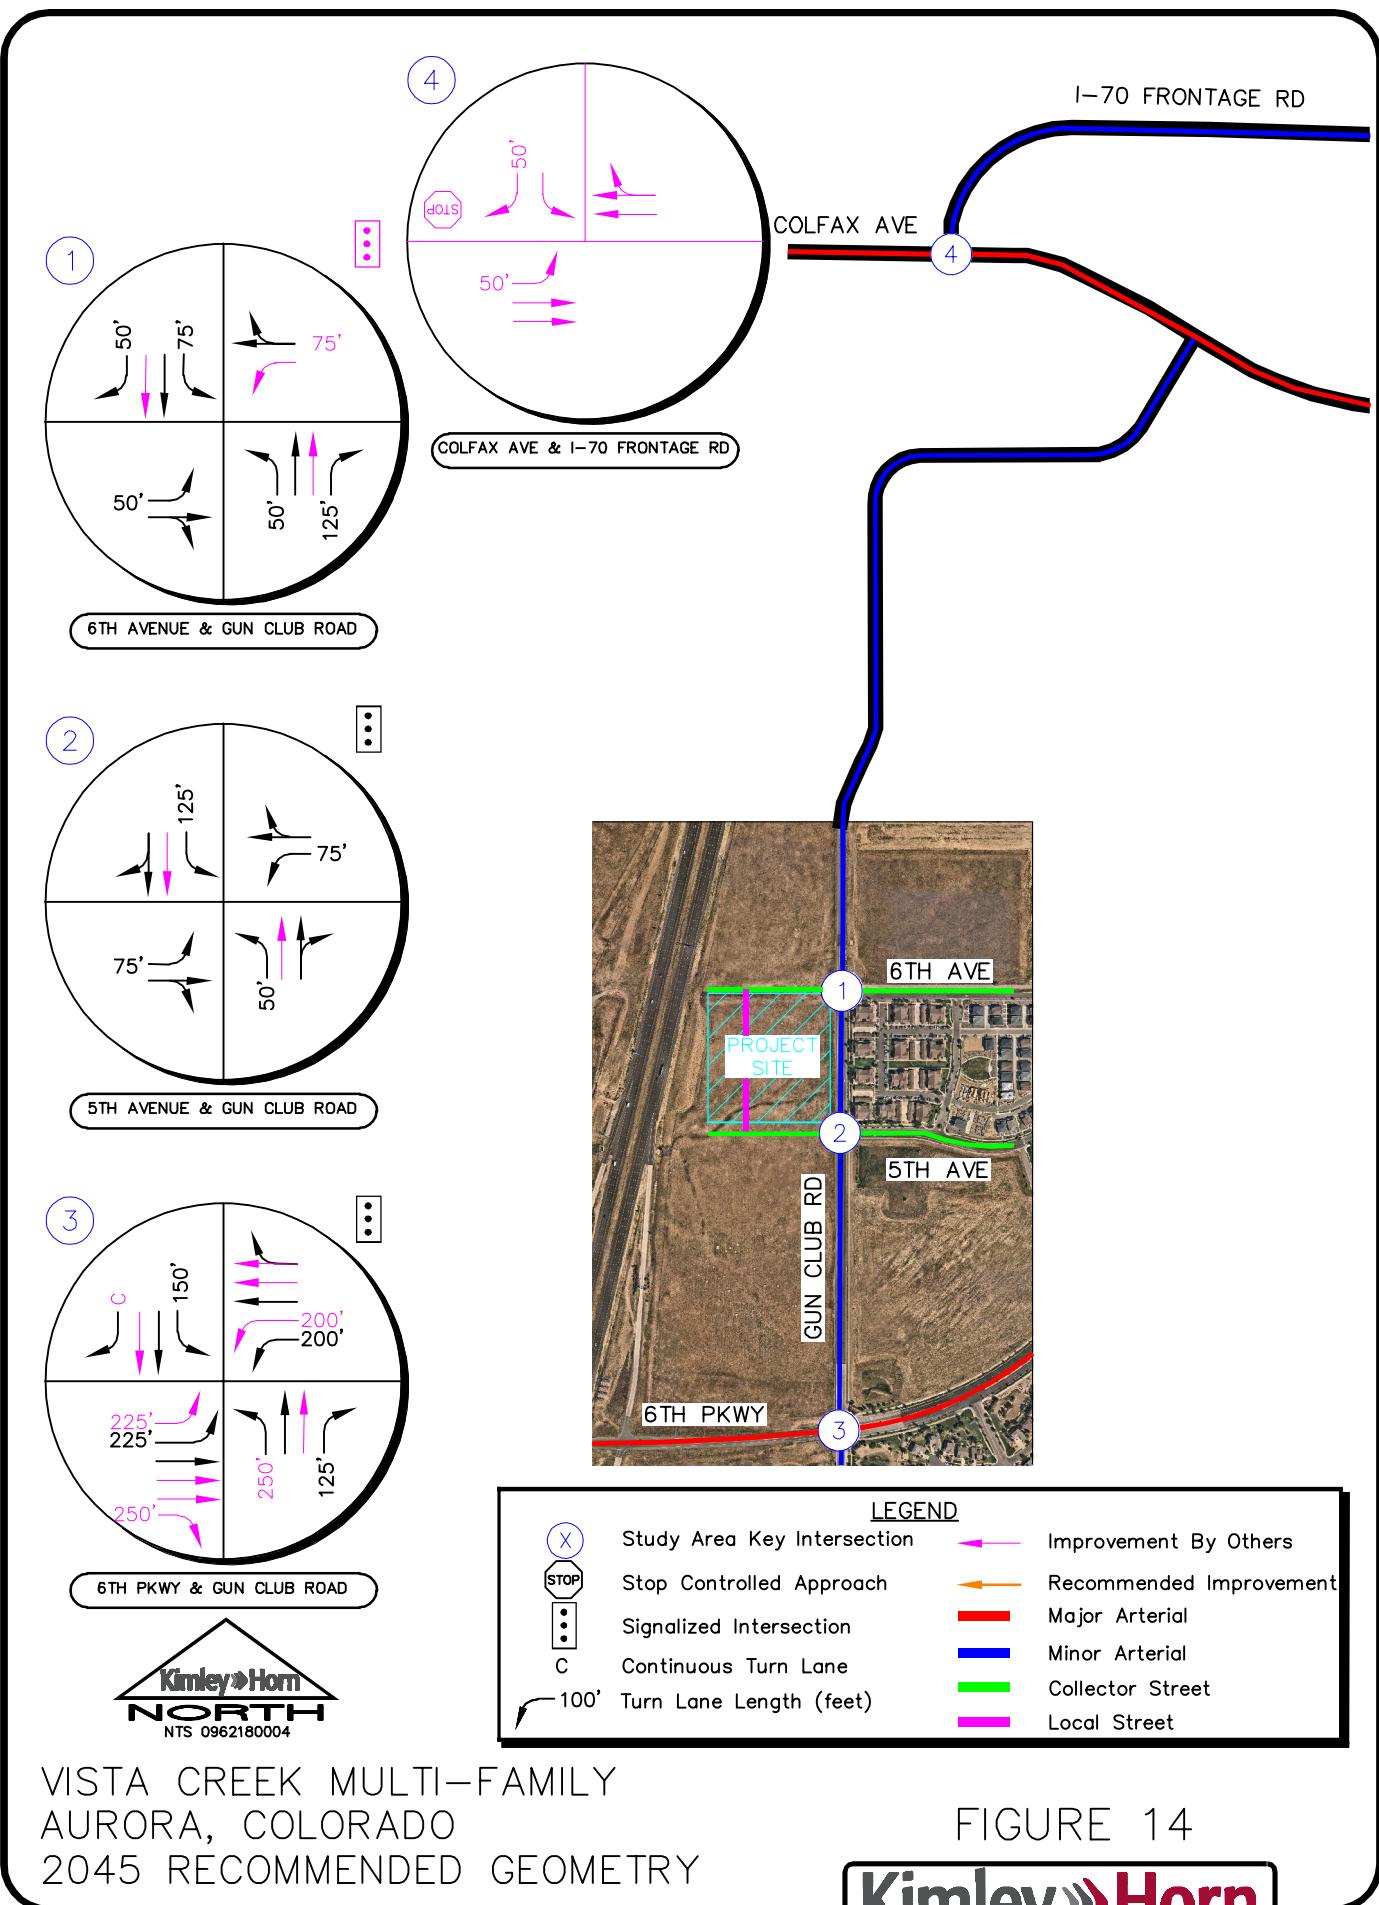

Within the project area, sidewalks exist on the north and south sides of 6th Parkway east of Gun Club Road. Gun Club Road provides a sidewalk on the east side of the roadway south of 5th Avenue. Sidewalks currently exist on the north and south sides of 5th Avenue adjacent to the project. 6th Avenue currently has a sidewalk on the south side of the roadway. There are no existing sidewalks on Colfax Avenue. The Regional Transportation District (RTD) facilities maps shows no existing bus routes in the site vicinity. Also, no bike lanes are present adjacent to the site.

With project construction, sidewalks are proposed on both sides of the 5th Avenue extension and on the south side of the 6th Avenue extension. Sidewalks will also be provided throughout the project site.

5.6 Improvement Summary

Based on the results of the intersection operational and vehicle queuing analysis, the key intersection recommended improvements and control are shown in **Figure 13** for the 2024 project buildout year and **Figure 14** for the long-term 2045 horizon.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the analysis presented in this report, Kimley-Horn believes Vista Creek Multi-Family will be successfully incorporated into the existing and future roadway network. Analysis of the existing street network, the proposed project development, and expected traffic volumes resulted in the following conclusions and recommendations:

2024 Recommendations

- With buildup of the project, the west leg will be constructed at the intersection of 6th Avenue and Gun Club Road and will provide access to the project. The eastbound exiting approach of this intersection should provide two egress lanes with a 50-foot eastbound left turn lane and a shared through/right turn lane. It is recommended that a R1-1 “STOP” sign be installed by the project at the eastbound approach of the 6th Avenue and Gun Club Road intersection. A northbound and southbound left turn lane and a southbound right turn lane should be implemented at the 6th Avenue and Gun Club Road intersection. The northbound left turn lane and southbound right turn lane should be constructed by the project, whereas the southbound left turn lane is anticipated to be constructed by Cross Creek. These northbound left and southbound right turn lanes should provide 50 feet of length. The southbound left turn lane should provide a length of 75 feet. The existing southbound left turn volumes warrant a turn lane with City of Aurora standards.
- It is anticipated that the proposed adjacent development to the south, Lamar Landing Subdivision, will be built out prior to the project and will construct the west leg and a northbound left turn lane at the 5th Avenue and Gun Club Road intersection. The intersection of 5th Avenue and Gun Club Road is anticipated to meet four-hour vehicular volume warrants in 2024; therefore, signalization is anticipated to be appropriate control at this intersection by 2024. If signalized, the eastbound and westbound approaches of this intersection should provide 75-foot designated left turn lanes and a shared through/right turn lane and the northbound approach should consist of a 50-foot designated left turn lane and a shared through/right turn lane. It should be noted that signalization is triggered by traffic volumes on the east leg of this intersection; therefore, it is believed that westbound left turn lane and signalization will be constructed in association with the development of Cross Creek.

- It is recommended that the eastbound left turn lane at the 6th Parkway and Gun Club Road intersection be extended to 225 feet. A southbound right turn should be constructed with a length of 50 feet at this intersection. These turn lane improvements are anticipated with development of the Lamar Landing project.

2045 Recommendations

- By 2045, the City of Aurora six-lane cross section is expected to be provided by others along 6th Parkway within the project limits. Further, Gun Club Road is expected to be constructed by others to the ultimate street section of two through lanes in each direction.
- The intersection of 6th Avenue and Gun Club Road is anticipated to meet four-hour vehicular volume warrants in 2045; therefore, signalization may be needed by 2045 which is consistent with the Aurora Crossroads study. If signalized, the westbound approaches of this intersection should provide a designated left turn lane. It should be noted that signalization is triggered by traffic volumes on the east leg of this intersection; therefore, it is believed that westbound left turn lane and signalization will be constructed in association with the development of Cross Creek.
- Eastbound and westbound dual left turn lanes and an eastbound right turn lane may be needed at the 6th Parkway and Gun Club Road intersection by 2045. It should be noted that these improvements are consistent with the findings in the Aurora Crossroads study and should be provided as a background improvement.
- By 2045, the intersection of Colfax Avenue and I-70 Frontage Road is anticipated to be realigned so that Colfax Avenue extends east-west, and the I-70 Frontage Road extend north-south. With this realignment, the eastbound approach should consist of a left turn lane and two through lanes while the westbound approach should include two through lanes with the outside lane being a shared through/right turn lane. The southbound approach should be stop-controlled with a R1-1 STOP sign and provide separate left and right turn lanes. Of note, these improvements are consistent with the findings in the Aurora Crossroads study and should be provided as a background improvement.

General Recommendations:

- Any on-site and off-site roadway, signing, striping, and signal improvements should be incorporated into the Civil Drawings, and conform to City of Aurora standards as well as the Manual on Uniform Traffic Control Devices – 2009 Edition (MUTCD).

Re: E-470 and 6th Pkwy FDP
Aurora, CO
LSC #180220

Dear Mr. Spehalski:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed E-470 and 6th Pkwy FDP development to respond to comments from the City of Aurora. As shown on Figure 1, the site is located south of E. 6th Parkway and west of North Gun Club Road in Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected Phase 1 and Buildout short-term and Buildout long-term background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements to mitigate the site's traffic impacts.

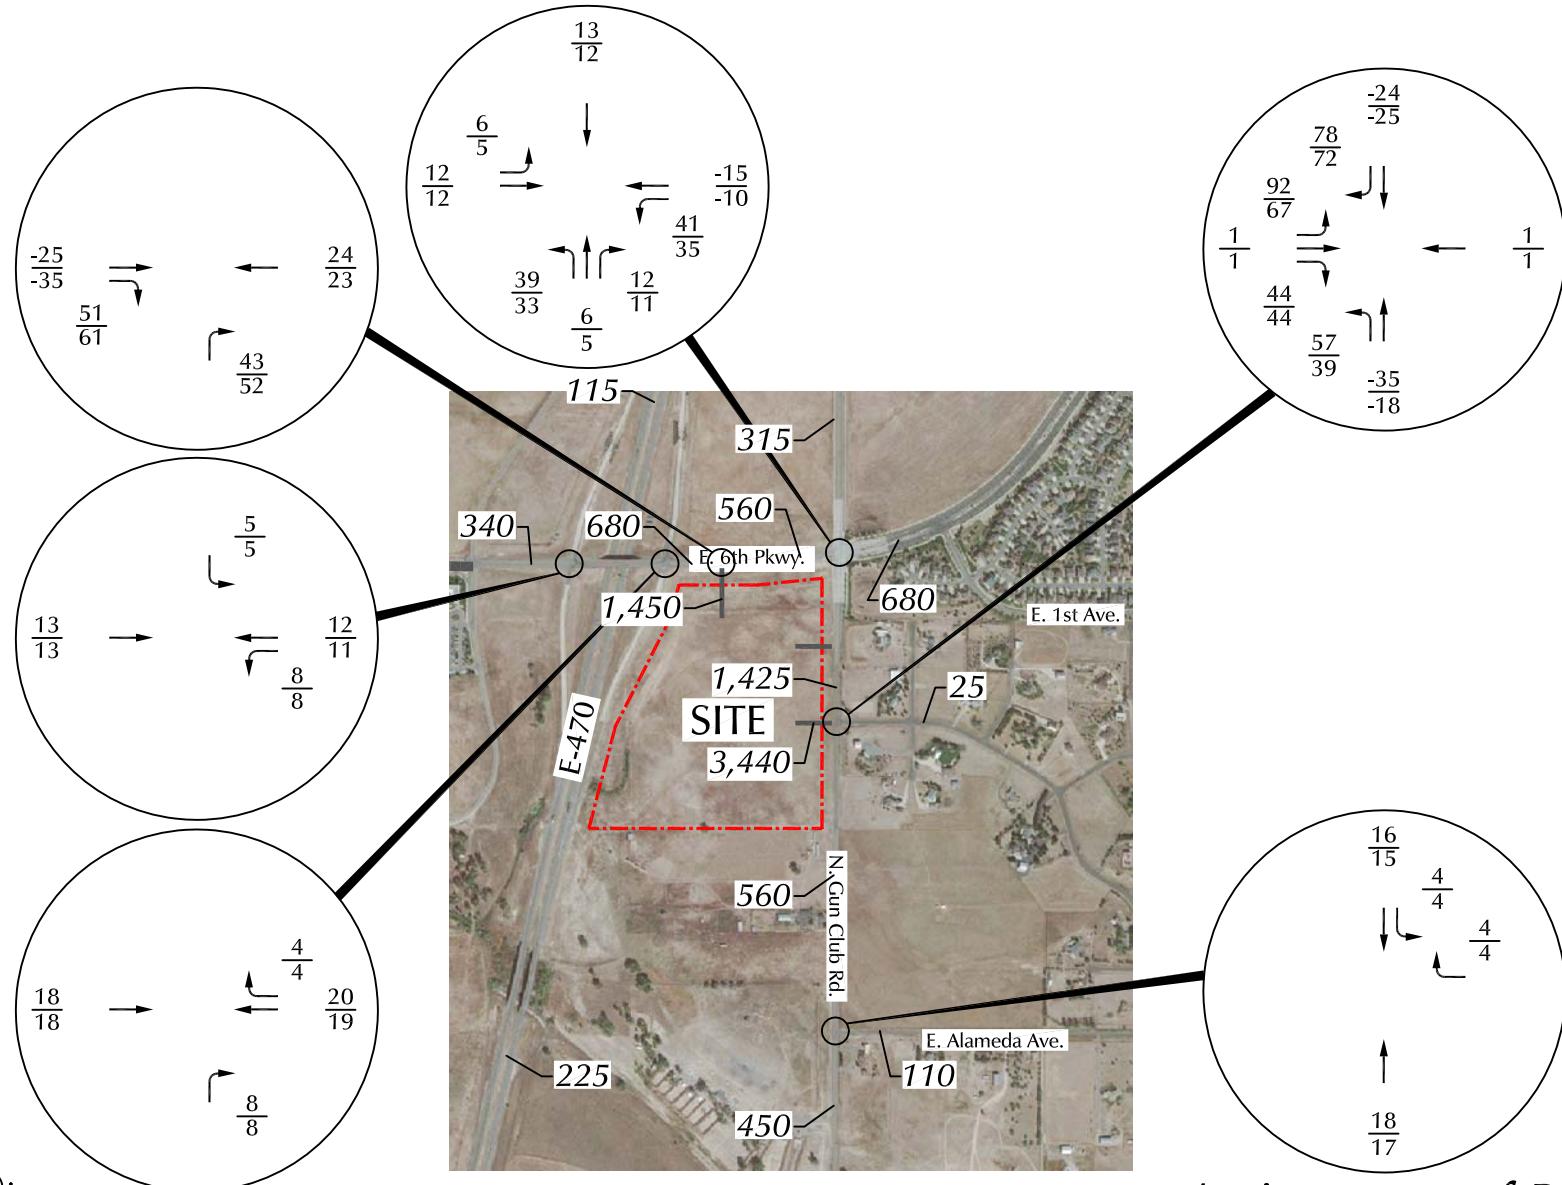

LAND USE AND ACCESS

The site is proposed to include a grocery store with about 90,000 square feet, about 95,790 square feet of retail shopping center space, about 6,030 square feet of fast-food restaurant, about 27,000 square feet of office space, and two gas stations. Access is proposed from one right-in/right-out access to E. 6th Parkway and one full movement and one three-quarter movement access locations to N. Gun Club Road. Figure 2 shows the conceptual site plan.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

 Checked by _____ Date _____ Sheet No. 1 of 1

TRIP GENERATION MANUAL TECHNIQUES

ITE Trip Generation Manual 10th Edition, Fitted Curve Equations

Land Use Code - Multifamily Housing (Mid-Rise) (221)

Independent Variable - Dwelling Units (X)

$$X = 321$$

T = Average Vehicle Trip Ends

Peak Hour of Adjacent Street Traffic, One Hour Between 7 and 9 a.m. (Series 200 Page 74)

$\ln(T) = 0.98 \ln(X) - 0.98$ $\ln(T) = 0.98 * \ln(321.0) - 0.98$	Directional Distribution: 26% ent. 74% exit. T = 107 Average Vehicle Trip Ends 28 entering 79 exiting 28 + 79 = 107
--	---

Peak Hour of Adjacent Street Traffic, One Hour Between 4 and 6 p.m. (Series 200 Page 75)

$\ln(T) = 0.96 \ln(X) - 0.63$ $\ln(T) = 0.96 * \ln(321.0) - 0.63$	Directional Distribution: 61% ent. 39% exit. T = 136 Average Vehicle Trip Ends 83 entering 53 exiting 83 + 53 = 136
--	---

Weekday (Series 200 Page 73)

$(T) = 5.45 * (X) - 1.75$ $(T) = 5.45 * 321 - 1.75$	Directional Distribution: 50% ent. 50% exit. T = 1748 Average Vehicle Trip Ends 874 entering 874 exiting 874 + 874 = 1748
--	---

Peak Hour of Generator, Saturday (Series 200 Page 79)

$(T) = 0.42 * (X) + 6.73$ $(T) = 0.42 * 321 + 6.73$	Directional Distribution: 49% ent. 51% exit. T = 142 Average Vehicle Trip Ends 70 entering 72 exiting 70 + 72 = 142
--	---

TRIP GENERATION MANUAL TECHNIQUES

ITE Trip Generation Manual 10th Edition, Average Rate Equations

Land Use Code - Multifamily Housing (Mid-Rise) (221)

Independent Variable - Dwelling Units (X)

$$X = 321$$

T = Average Vehicle Trip Ends

Peak Hour of Adjacent Street Traffic, One Hour Between 7 and 9 a.m. (Series 200 Page 74)

$T = 0.36 * X$ Directional Distribution: 26% ent. 74% exit.
 $T = 0.36 * 321.0$ T = 116 Average Vehicle Trip Ends
30 entering 86 exiting
30 + 86 = 116

Peak Hour of Adjacent Street Traffic, One Hour Between 4 and 6 p.m. (Series 200 page 75)

$T = 0.44 * X$ Directional Distribution: 61% ent. 39% exit.
 $T = 0.44 * 321.0$ T = 141 Average Vehicle Trip Ends
86 entering 55 exiting
86 + 55 = 141

Weekday (Series 200 Page 73)

Daily Weekday Directional Distribution: 50% entering, 50% exiting
 $T = 5.44 * X$ T = 1746 Average Vehicle Trip Ends
 $T = 5.44 * 321.0$ 873 entering 873 exiting
873 + 873 = 1746

Peak Hour of Generator, Saturday (Series 200 Page 79)

Daily Weekday Directional Distribution: 49% ent. 51% exit.
 $T = 0.44 * X$ T = 141 Average Vehicle Trip Ends
 $T = 0.44 * 321.0$ 69 entering 72 exiting
69 + 72 = 141
