I. INTRODUCTION

Windler Homestead (Windler) Master Plan (MP) is a mixed-use development, consisting of single-family residential, multifamily residential, office space, retail, industrial/warehousing uses, and an elementary school. The approximately 852-acre site, currently vacant, is split into two adjoining pieces on either side of E-470. The first is roughly a full section of land east of E-470, north of the future 48th Avenue, west of the future Harvest Road, and south of 56th Avenue. The second is roughly a half section of land west of E-470, north of the future 42nd Avenue, east of the future Tibet Road, and south of the future 52nd Avenue and excludes the roughly 20-acre Brandenburg Parcel, part of the 310 West development, located on the northeast corner of the future intersection of Tibet Road and 48th Avenue. At build-out, the proposed development would consist of 3,310 units of single-family housing, 2,185 multifamily units, 648,900 square feet of retail space, 290,000 square feet of office space, 2.2 million square feet of industrial/warehousing space, and a 300-student elementary school. **Figure 1** illustrates the location of the site and the adjacent roadway network. **Figure 2** depicts the current land use plan. The site will have access to several collector and arterial roadways surrounding the site, namely; Tibet Road, 48th Avenue, 56th Avenue, and Harvest Road.

The purpose of this traffic study is to identify the potential impacts specific to the Windler MP development and any resultant required roadway or traffic control improvements. The study will explore full buildout of the site, evaluating a Long-Range (year 2040) planning horizon for the site. This planning horizon is based on the City of Aurora's 2018 *Northeast Area Transportation Study* (NEATS). Additional studies and conformance letters are anticipated with each subdivision application will provide more clarity on internal site transportation infrastructure and intersection geometries. This study is intended to establish the needs for the major roadway network, arterials and collectors, and proposed connections to those roadways.

NORTH

FIGURE 2
Site Plan Concept

II. EXISTING CONDITIONS

II.A. Surrounding Land Use

The area around the Windler site primarily consists of vacant land. The Green Valley Ranch East residential development exists immediately to the west of the future Tibet Road in Denver. Fulenwider Harvest Mile, Porteos, and Sun Empire are planned FDPs located north and east of the site and represent the other three quadrants of the future intersection of 56th Avenue and Harvest Road. Denver International Airport (DEN) is located approximately two and a half miles northeast of the site.

II.B. Transportation Network

Roadways

The existing transportation system around Windler includes the following facilities:

- **56th Avenue.** This east-west facility serves as the northern boundary of the site and consists of a two-lane cross-section with turn lanes located at the E-470 Interchange. The posted speed limit is 45 miles per hour (mph).
- **E-470.** This four-lane tollway facility runs north-south and splits the FDP site. A grade-separated interchange is provided at 56th Avenue and at 64th Avenue north of the site. A future interchange is planned at 48th Avenue, connecting the parcels on each side of the highway.

II.C. Traffic Volumes and Operations

A 72-hour automated traffic count was recently conducted on 56th Avenue adjacent to the anticipated site. AM and PM peak hour turning movements counts were recently conducted at the following intersections:

- 56th Avenue with E-470 NB Ramps
- 56th Avenue with E-470 SB Ramps

Appendix A contains the traffic count data. **Figure 3** depicts the existing traffic volumes. As shown, 56th Avenue currently serves approximately 7,800 vehicles per day (VPD) adjacent to the site. These current volumes are well below the Level of Service (LOS) C daily threshold established in the 2018 NEATS study for two-lane roadways.

Calculations were conducted to assess operations given current traffic demands. These were conducted using techniques documented in the *Highway Capacity Manual (HCM) 6th Edition*, (Transportation Research Board, 2016) using the existing traffic volumes and intersection geometry. Level of Service (LOS) is a qualitative measure of traffic operational conditions, based on roadway capacity and vehicle delay. Levels of service are described by a letter designation ranging from A to F, with LOS A representing free-flow travel, while LOS F represents congested conditions. For signalized intersections, LOS is calculated for the entire intersection while LOS for unsignalized intersections is calculated for movements that must yield right-of-way to other traffic movements.

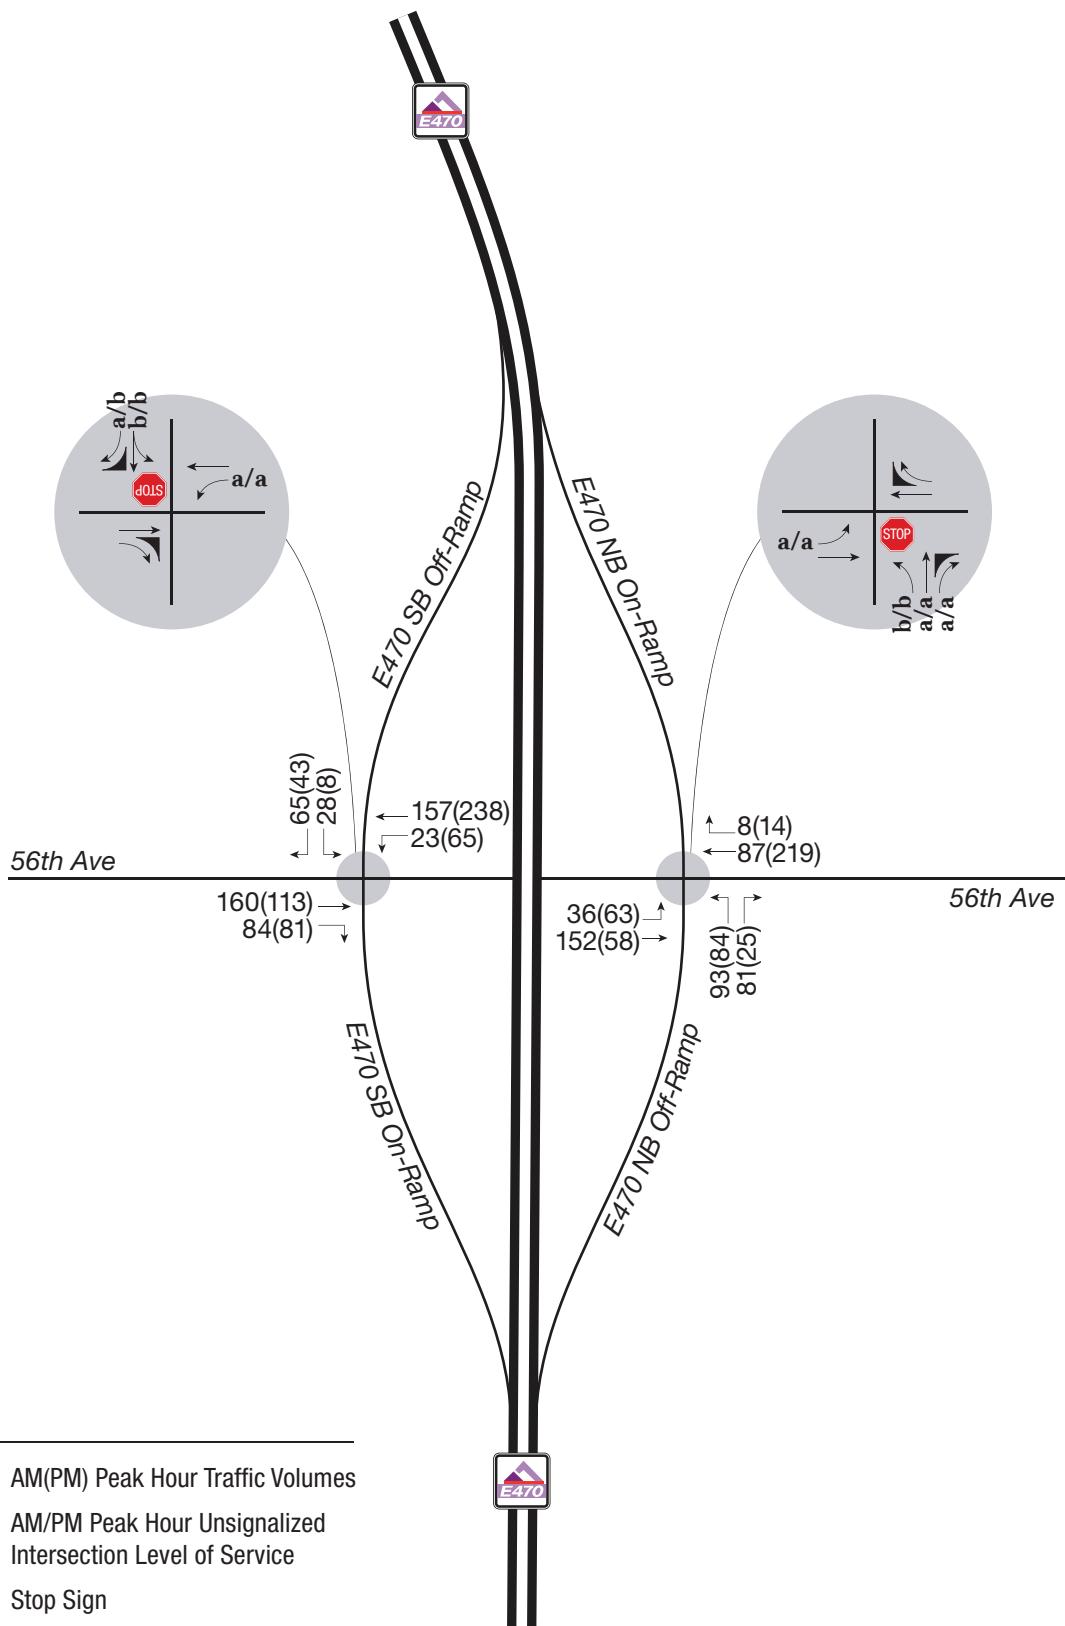

Table I summarizes LOS criteria for signalized and unsignalized (stop-controlled & roundabout) intersections. Synchro 11 was utilized for stop-control and signalized intersections, and SIDRA Intersection 9 for roundabout analysis within this report, with both software packages utilizing HCM methodologies.

Table I. Level of Service (LOS) Criteria

Level of Service	Average Control Delay per Vehicle (sec/veh)	
	Signalized Intersections	Stop/Roundabout Controlled Intersections
A	≤ 10	≤ 10
B	> 10 to 20	> 10 to 15
C	> 20 to 35	> 15 to 25
D	> 35 to 55	> 25 to 35
E	> 55 to 80	> 35 to 50
F	> 80	> 50

HCM 6th Edition, Exhibit 19-8 & Exhibit 20-2

Figure 3 depicts the existing intersection geometrics, traffic control, and intersection LOS results, and **Appendix B** contains existing LOS worksheets. As indicated, existing traffic operations at the study area intersections are acceptable, all intersection movements are anticipated to operate at LOS B or better, during the peak times analyzed.

III. PROPOSED CONDITIONS

III.A. Trip Generation

The *Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition, 2021* was used to estimate trip generation. The development would consist of 3,310 units of single-family housing, 2,185 multifamily units, 648,900 square feet of retail space, 290,000 square feet of office space, 2.2 million square feet of industrial/warehousing space, and a 300-student elementary school. This analysis used a mix of regression equations and average rates for the corresponding ITE code based on the methodology outlined in *ITE Trip Generation Handbook, 3rd Edition, 2017* for selecting the proper rates. **Table 2** shows the trip generation rates and equations for each land use code.

Table 2. ITE Trip Generation Rates and Equations

Land Use	ITE Code	Unit	Daily	Peak	Equations & Rates		Distributions	
					In	Out	In	Out
General Light Industrial	110	KSF	$T=3.76*X+50.47$	AM	$T=0.68*X+3.81$	88%	12%	
				PM	$\ln(T)=0.72*\ln(X)+0.38$	14%	86%	
High-Cube Transload & Short-Term Storage Warehouse	154	KSF	$T=6.41*X+75.31$	AM	$T=0.31*X+22.85$	24%	76%	
				PM	$T=0.43*X+20.55$	63%	37%	
Single-family Detached	210	DU	$\ln(T)=0.92*\ln(X)+2.68$	AM	$\ln(T)=0.91*\ln(T)+0.12$	26%	74%	
				PM	$\ln(T)=0.94*\ln(X)+0.27$	63%	37%	
Multifamily (Low-Rise)	220	DU	$T=6.41*X+75.31$	AM	$T=0.31*X+22.85$	24%	76%	
				PM	$T=0.43*X+20.55$	63%	37%	
Elementary School	520	Students	$T=2.27*X$	AM	$T=0.74*X$	54%	46%	
				PM	$T=0.16*X$	46%	54%	
General Office	710	KSF	$T=10.84*X$	AM	$T=1.52*X$	88%	12%	
				PM	$T=1.44*X$	17%	83%	
Shopping Center (>150 KSF)	820	KSF	$T=10.84*X$	AM	$T=1.52*X$	88%	12%	
				PM	$T=1.44*X$	17%	83%	
Shopping Plaza (40-150 KSF)	821	KSF	$T=67.52*X$	AM	$T=1.73*X$	62%	38%	
				PM	$T=5.19*X$	49%	51%	
Strip Retail Plaza (<40KSF)	822	KSF	$T=42.2*X+229.68$	AM	$T=2.36*X$	60%	40%	
				PM	$T=6.59*X$	50%	50%	

DU = Dwelling Units KSF = 1,000 SF

Table 3 outlines the estimated vehicle-trip generation for the proposed development. The Windler development is anticipated to generate a total of 88,699 vehicle trips per day and approximately 5,454 and 8,226 trips during the AM and PM peak hours, respectively.

Internal trip capture was determined using the National Cooperative Highway Research Program (NCHRP) 684 spreadsheet. Given the NCHRP 684 internal capture calculation methods, approximately 11 percent of the total generated trips were found to be internal, and 16 percent of the PM trips were determined to be internal. This equates to an estimated internal trip capture of 614 vehicle-trips during the AM peak hour and 1,232 vehicle-trips during the PM peak hour.

Additionally, A pass-by trip deduction was applied to traffic on the adjacent roadway. Pass-by trips consist of existing trips on the adjacent roadway that choose to make an interim stop on the way to their destination. Pass-by trip percentages from the *ITE Trip Generation Handbook* were used for the appropriate uses. **Appendix C** shows the NCHRP 684 internal capture summary sheets.

III.B. Site Trip Distribution and Site-Generated Traffic Assignment

The trip generation estimates from were assigned to the adjacent roadway system based on existing travel patterns, travel demand modeling information, and engineering judgment. The following distribution percentages were used to assign the site generated trips to the roadway network:

- **5%** oriented to/from the north on Harvest Road
- **10%** percent oriented to/from the east on 56th Avenue
- **18%** oriented to/from the west on 56th Avenue
- **10%** oriented to/from the north on E-470
- **15%** oriented to/from the south on E-470
- **10%** oriented to/from the east on 48th Avenue
- **12%** oriented to/from the west on 48th Avenue
- **4%** oriented to/from the south on Tibet Road
- **5%** oriented to/from the north on Tibet Road
- **1%** oriented to/from the south on Buchanan Street
- **7%** oriented to/from the south on Denali Boulevard
- **1%** oriented to/from the south on Fultondale Street
- **2%** oriented to/from the south on Wenatchee Street

Figure 4 shows the site trip distribution and resultant traffic assignment for external site generated trips that come in and out of the development via the surrounding roadway network. **Figure 5** shows the traffic assignment for site generated trips within the development. These trips are indicated as internal capture trips in. As indicated, 48th Avenue would carry between 5,900 and 20,500 VPD of site-generated traffic, 56th Avenue would carry between 4,800 and 12,400 VPD of site-generated traffic, Tibet Road would carry between 1,700 and 6,500 VPD of site-generated traffic, Harvest Road would carry between 4,100 and 4,700 VPD of site-generated traffic, and Denali Boulevard would carry between 9,100 and 10,700 VPD of site-generated traffic.

IV. BACKGROUND CONDITIONS

This section presents background traffic projections for the buildout 2040 planning horizon. The following subsections describe the anticipated roadway network identified by NEATS, and the derivation of background traffic projections using the NEATS travel demand model.

IV.A. Transportation Network

As indicated, this study provides Year 2040 Buildout transportation recommendations for the roadways. The NEATS study area encompasses a regional area extending from approximately between Tower Road east to Schumaker Road and from Jewell Avenue on the south to 72nd Avenue on the north.

Recommendations with respect to the Windler development include the construction of the following roadway network:

Six-lane Tollway

- E-470 adjacent to and through the site

Six-lane Major Arterials

- Harvest Road adjacent to the site
- 56th Avenue adjacent to the site
- 48th Avenue adjacent to and through the site

Four-lane Minor Arterials:

- Tibet Road adjacent to the site
- Denali Boulevard through the site

The above descriptions set the stage relative to the network and intersection through-lanes used in this effort with respect to the study area intersections. However, three significant developments have occurred related to the proposed roadway network since the development of the latest NEATS revision:

1. The parcel immediately north of 56th Avenue, within the Fulenwider Harvest Mile development, does not intend to construct Denali Boulevard between 56th Avenue and 60th Avenue. As a result of this break in connectivity to the north and the fact that Denali Boulevard is only constructed as far south as 38th Avenue within Aurora Highlands, the previously anticipated through volumes are projected to be reduced, allowing for the roadway classification to be downgraded to a collector roadway with half mile spacing between E-470 and Harvest Road, consistent with Aurora roadway network guidelines detailed within both NEATS and the City of Aurora Unified Development Ordinance (UDO).
2. Major changes are proposed to the alignment of Aerotropolis Parkway. NEATS had previously explored a diagonal connection between Powhaton Road and Harvest Road between 48th Avenue and 56th Avenue. A current effort being undertaken by the City of Aurora now recommends the diagonal occur between Powhaton Road and Jackson Gap Street. This new recommendation results in a significant reduction in traffic volumes along Harvest Road adjacent to the Windler site. Given this reduction in volumes, this NEATS update has preliminarily recommended that Harvest Road be constructed as a four-lane minor arterial between 48th Avenue and 64th Avenue.
3. An analysis of Green Valley Ranch East FDP determined that volumes along Tibet Street south of 48th Avenue do not support the previously proposed four-lane arterial, and the recommended cross-section was downgraded to a three-lane collector. Tibet Street will remain a four-lane arterial north of 48th Avenue.

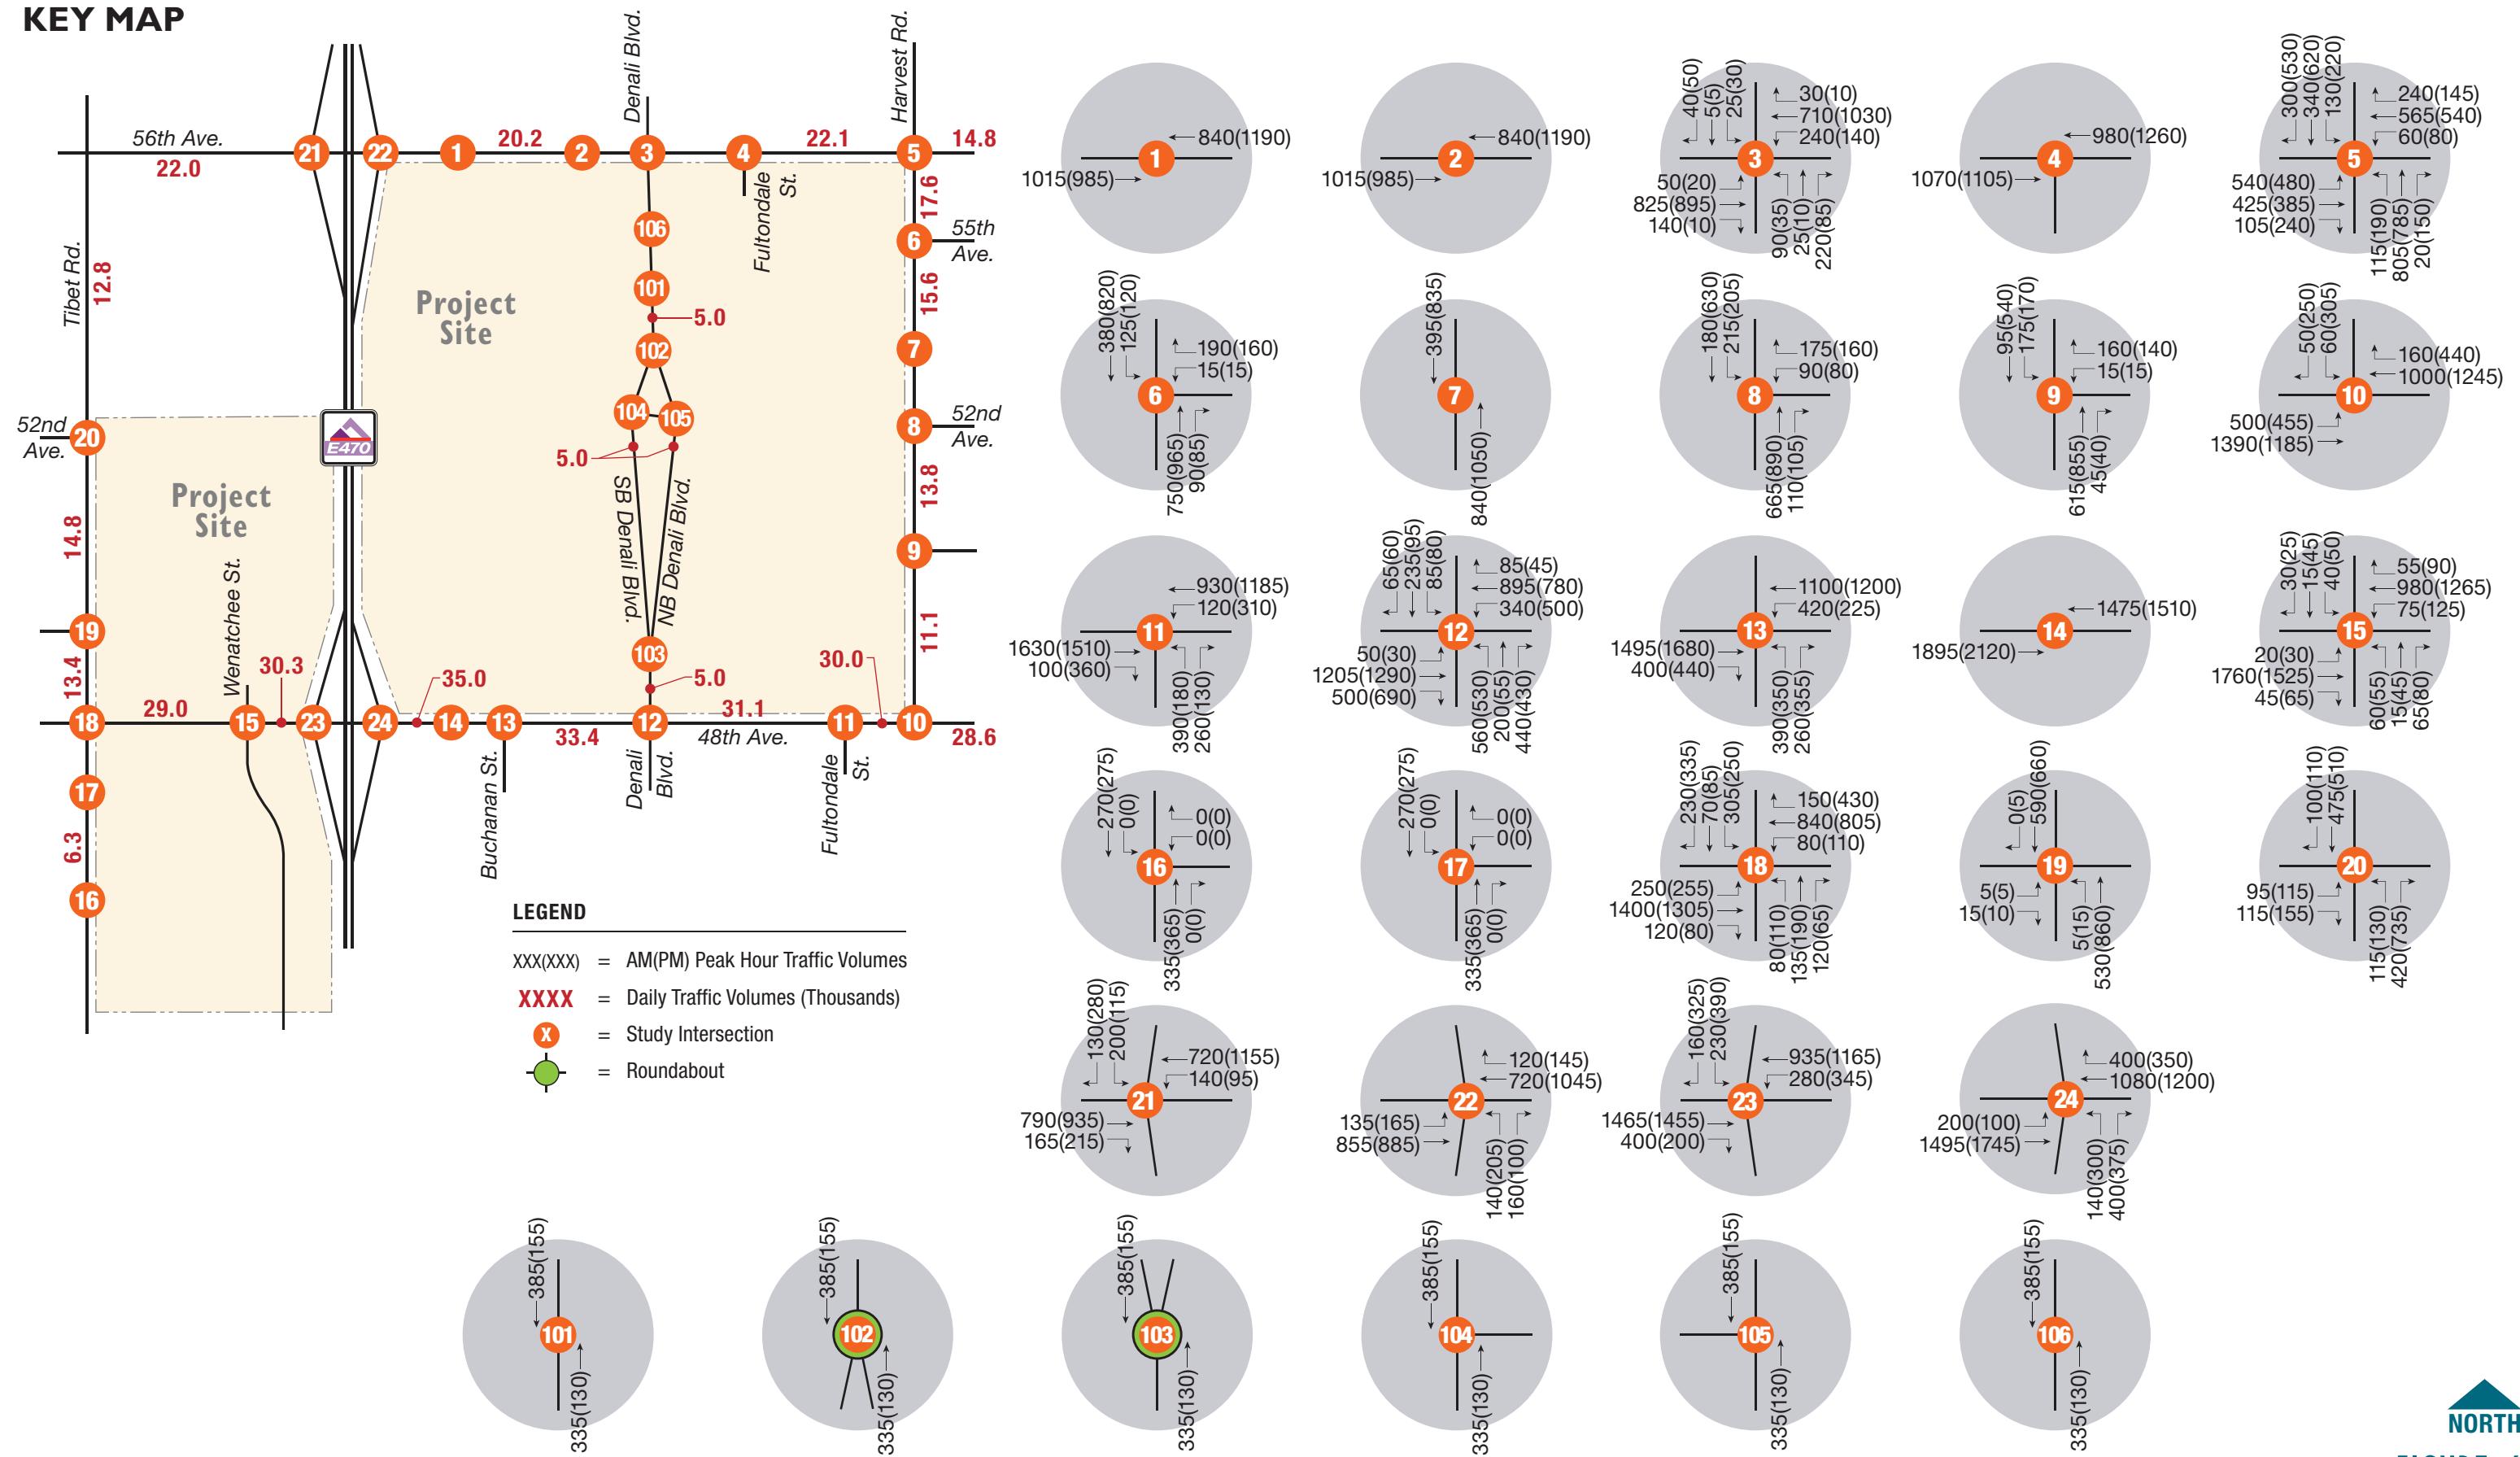

IV.B. Traffic Volumes and Operations

The NEATS travel demand model was used as the primary means of developing background traffic for the Windler development traffic study. Specifically, raw model results were extracted from the 2040 travel demand models, and trips estimated to originate from the Windler property, within the NEATS models, were manually removed from the totals, yielding model-based daily background traffic. Other nearby development's traffic studies were also considered in an effort to further refine volumes provided in NEATS based on planned development in the area. Those studies included TIS's for the adjacent developments of Fulenwider Harvest Mile, Sun Empire, Green Valley Ranch East, and 310 West, as well as the unpublished study being conducted by the City of Aurora regarding a new preferred alignment for Aerotropolis Parkway discussed in the previous section of this report.

Background traffic volume estimates for the 2040 Buildout scenario are shown in **Figure 6**. In 2040 background traffic volumes adjacent to the site along 48th Avenue are anticipated to be between 28,600 and 35,000 VPD, 56th Avenue would carry between 14,800 and 22,100 VPD, Tibet Road would carry between 6,300 and 14,800 VPD, Harvest Road would carry between 11,100 and 17,600 VPD and Denali Boulevard would carry approximately 5,000 VPD.

Figure 7 depicts the anticipated background intersection geometrics, traffic control, and intersection LOS results, and **Appendix B** contains LOS worksheets. At the signalized intersections in the study area, all intersections are anticipated to operate at LOS D or better during the peak times analyzed. At unsignalized intersections in the study area, all movements are expected to operate at LOS D or better except for the westbound left-turn movement at the intersection of Harvest Drive with Drive 5 (ID# 9), which is expected to operate at LOS E during the PM peak hour. It should be noted that it is not uncommon for side street movements to operate to a LOS E or F during peak hours. It is anticipated that traffic may divert to the adjacent signalized intersection of Harvest Road with 52nd Avenue to avoid long queues and delay, if any.

Lane Geometry and Level of Service

V. TOTAL FUTURE TRAFFIC

V.A. Transportation Network

The buildup transportation network is anticipated to be consistent with NEATS, with the exceptions described in the background section of this report. In addition to the NEATS roadway network Windler is required to provide an east-west collector on the half mile spacing between the arterial roadways of 56th Avenue and 48th Avenue, which will be achieved with the construction of 52nd Avenue to meet standards set forth in NEATS. Additional roadways that will function as hybrids between collectors and local streets, known as “connectors,” will also be provided via 53rd Avenue as an east-west connection on the northern 1/3 of the full section east of E-470, and via Buchanan Street as a north-south connection on the western 1/3 of the full section east of E-470.

V.B. Traffic Volumes and Operations

The external and internal site-generated traffic volumes from **Figure 4** and **Figure 5** were added to the year 2040 background traffic volumes shown in **Figure 6** to produce the 2040 total traffic volumes illustrated in **Figure 8**. By 2040, 48th Avenue volumes are anticipated to be between 34,500 and 55,400 VPD, 56th Avenue would carry between 20,000 and 34,200 VPD, Tibet Road would carry between 8,800 and 20,000 VPD, Harvest Road would carry between 15,600 and 27,800 VPD, and Denali Boulevard would carry between 14,100 and 15,700 VPD.

Intersection Operations Summary

Figure 9 depicts the anticipated buildup intersection geometrics, traffic control, and intersection LOS results, and **Appendix B** contains existing LOS worksheets. At the signalized intersections in the study area, all intersections are anticipated to operate at LOS D or better during the peak times analyzed except for the intersection of 48th Avenue with Denali Boulevard during the AM peak hour. At the unsignalized intersections in the study area, all movements are expected to operate at LOS D or better except for the following intersection movements:

- Eastbound and westbound shared left/through movement at the intersection of Harvest Road with Drive 5 under both peak hours (ID #9).
- Southbound right-turn movement at the intersection of 48th Avenue with Drive 7 during the PM peak hour (ID #14).
- Westbound shared left/through movement at the intersection of SB Denali Boulevard with 52nd Avenue during the AM and PM peak hours (ID #104).
- Westbound shared left-turn movement at the intersection of Tibet Road with Drive 8 during the PM peak hour (ID #19).

It should be noted that it is not uncommon for side street movements to operate to a LOS E or F during peak hours. It is anticipated that traffic may divert to the adjacent signalized intersection of Harvest Road with 52nd Avenue to avoid long queues and delay, if any. A LOS and delay summary table for 2040 future total year conditions is provided in **Appendix G**.

Denali Boulevard Operations & Conditions

Due to the planned data center now ending at 56th Avenue, Denali Boulevard is expected to be reconfigured to fit the needs of the surrounding neighborhoods and land uses. This will be accomplished by introducing Denali Street as a one-way couplet through the middle of Windler that will surround a park intended to be the centerpiece of the development. As noted previously, daily volumes along the street are expected to range from 14,100 and 15,700 VPD. The daily volumes on the Denali Boulevard couplets are anticipated to be approximately 7,300 VPD in each direction.

The street will be a four-lane, median divided street with attached 16-foot walks on each side at 56th Avenue and 48th Avenue and then leading up to the couplet section. Once in the core of Windler, volumes are expected to reduce such that a single lane in each direction will be adequate. The proposed cross section of each couplet, a single lane with on-street parking and bike lanes, is also expected to lend to reduced speeds. Proposed access drives along the couplet will function as RIRO intersections and are expected to operate with acceptable levels of service.

Roundabouts are proposed to be constructed at either end of the couplets to allow for safe and effective traffic operations. Roundabouts were analyzed at the intersections of Denali Boulevard with 52nd Avenue and Drive 9. The roundabout at Denali Boulevard with 52nd Avenue was analyzed as single-lane roundabouts with southbound right-turn drop-lane. At the Denali Boulevard with Drive 9 intersection the roundabout was analyzed as a two-lane roundabout with northbound and southbound two-lane approaches. A shared left/through and shared through/right-turn lanes should be provided on the north and south approaches. with a northbound two-lane approach. With the proposed southbound couplet being a single lane, the southbound approach would widen before roundabout to provide the two-lane approach. Two outgoing northbound lanes would be provided on the Denali Boulevard couplet north of the northbound before tapering into a single lane. Single-lane eastbound and westbound approaches would be provided at intersection. The roundabouts were analyzed using SIDRA Intersection 9 analysis software. All roundabout movements are anticipated to operate at LOS C or better during the AM and PM peak hours.

56th Avenue Operations & Conditions

56th Avenue is anticipated to be constructed as a six-lane cross-section with left-turn lanes provided at full-access points. Per the SHAC, right-turn lanes are generally not required at intersections along six-lane cross sections. A right-turn lane was recommended at the intersection of 56th Avenue with Denali Boulevard (ID #3) to improve traffic operations and safety due to high eastbound right-turn volumes. All signalized intersections along 56th Avenue are anticipated to operate at LOS D or better during the AM and PM peak hours. All movements at unsignalized intersections are anticipated to operate at LOS C or better during the peak periods. The intersections were analyzed with the assumption that the traffic signals would be coordinated to allow for efficient progression of traffic and upstream signals were considered for stop-controlled intersections along the corridor to account for the effect of upstream platooning to provide gaps in traffic. Based on the current site plan, it is anticipated that all proposed signalized intersections meet the required 660-feet of spacing, with the approximately at least 794-feet of spacing between the proposed traffic signal at E-470 SB Ramp (ID #18) and Drive (ID #1) having the least spacing.

Protected-T intersections or otherwise known as green T-intersections may be designed and implemented at the intersections along 56th Avenue with Drive 1 (ID #1), Drive 2 (ID #2), and Fultondale Street (ID #4). This allows for a two-stage westbound left-turn lane on the median. At the proposed signalized intersections of 56th Avenue with Drive 1 and Drive 2, the intersections are anticipated to operate at LOS A during the peak hours. At the stop-controlled of 56th Avenue with Fultondale Street, all movements are anticipated to operate at LOS C or better during the peak hours. If the intersections are designed to be protected-T intersections, traffic operations and progression are expected to improve due to the westbound movement essentially becoming a free-flow movement.

At the northbound and southbound E-370 interchange ramps with 56th Avenue, traffic operations are anticipated to be adequate. The intersections are anticipated to operate at LOS C during the peak hours under future 2040 traffic operations. The northbound and southbound off ramp approaches will provide a dedicated left-turn lane, a shared left/through-turn lane, and a dedicated right-turn lane. Although the westbound and eastbound left-turn lanes are currently being striped out for a single left-turn lane, it is anticipated that dual-left turn lanes will be needed based on future traffic projections. It was assumed that dual left-turn lanes would be needed and provided upon 2040 total future traffic conditions.

48th Avenue Operations & Conditions

48th Avenue is anticipated to be constructed as a six-lane cross-section with left-turn lanes provided at full-access points. Per the SHAC, right-turn lanes are generally not required at intersections along six-lane cross sections. However, right-turn lanes were recommended at the following intersections based on traffic volumes and operations:

- 48th Avenue with Harvest Road (ID #10)
- 48th Avenue with Denali Boulevard (ID #12)
- 48th Avenue with Drive 7 (ID #14)
- 48th Avenue with NB E-370 Ramp (ID #24)
- 48th Avenue with SB E-370 Ramp (ID #23)
- 48th Avenue with Tibet Road (ID #18)

All signalized intersections along 48th Avenue are anticipated to operate at LOS D or better during the AM and PM peak hours except for the intersection of 48th Avenue with Denali Boulevard (ID #12) during the AM peak hour. All movements at unsignalized intersections are anticipated to operate at LOS C during the peak periods except for the southbound right-turn movement at the intersection of 48th Avenue with Drive 7 (ID # 14) during the PM peak hour.

At the northbound and southbound E-370 interchange ramps with 48th Avenue, traffic operations are anticipated to be adequate. The intersections are anticipated to operate at LOS C or better during the peak periods under future 2040 traffic operations. The northbound and southbound off ramp approaches will provide a dedicated left-turn lane, a shared left/through-turn lane, and a dedicated right-turn lane. Although the westbound and eastbound left-turn lanes are currently being striped out for a single left-turn lane, it is anticipated that dual-left turn lanes will be needed based on future traffic projections. It was assumed that dual left-turn lanes would be needed and provided upon 2040 total future traffic conditions.

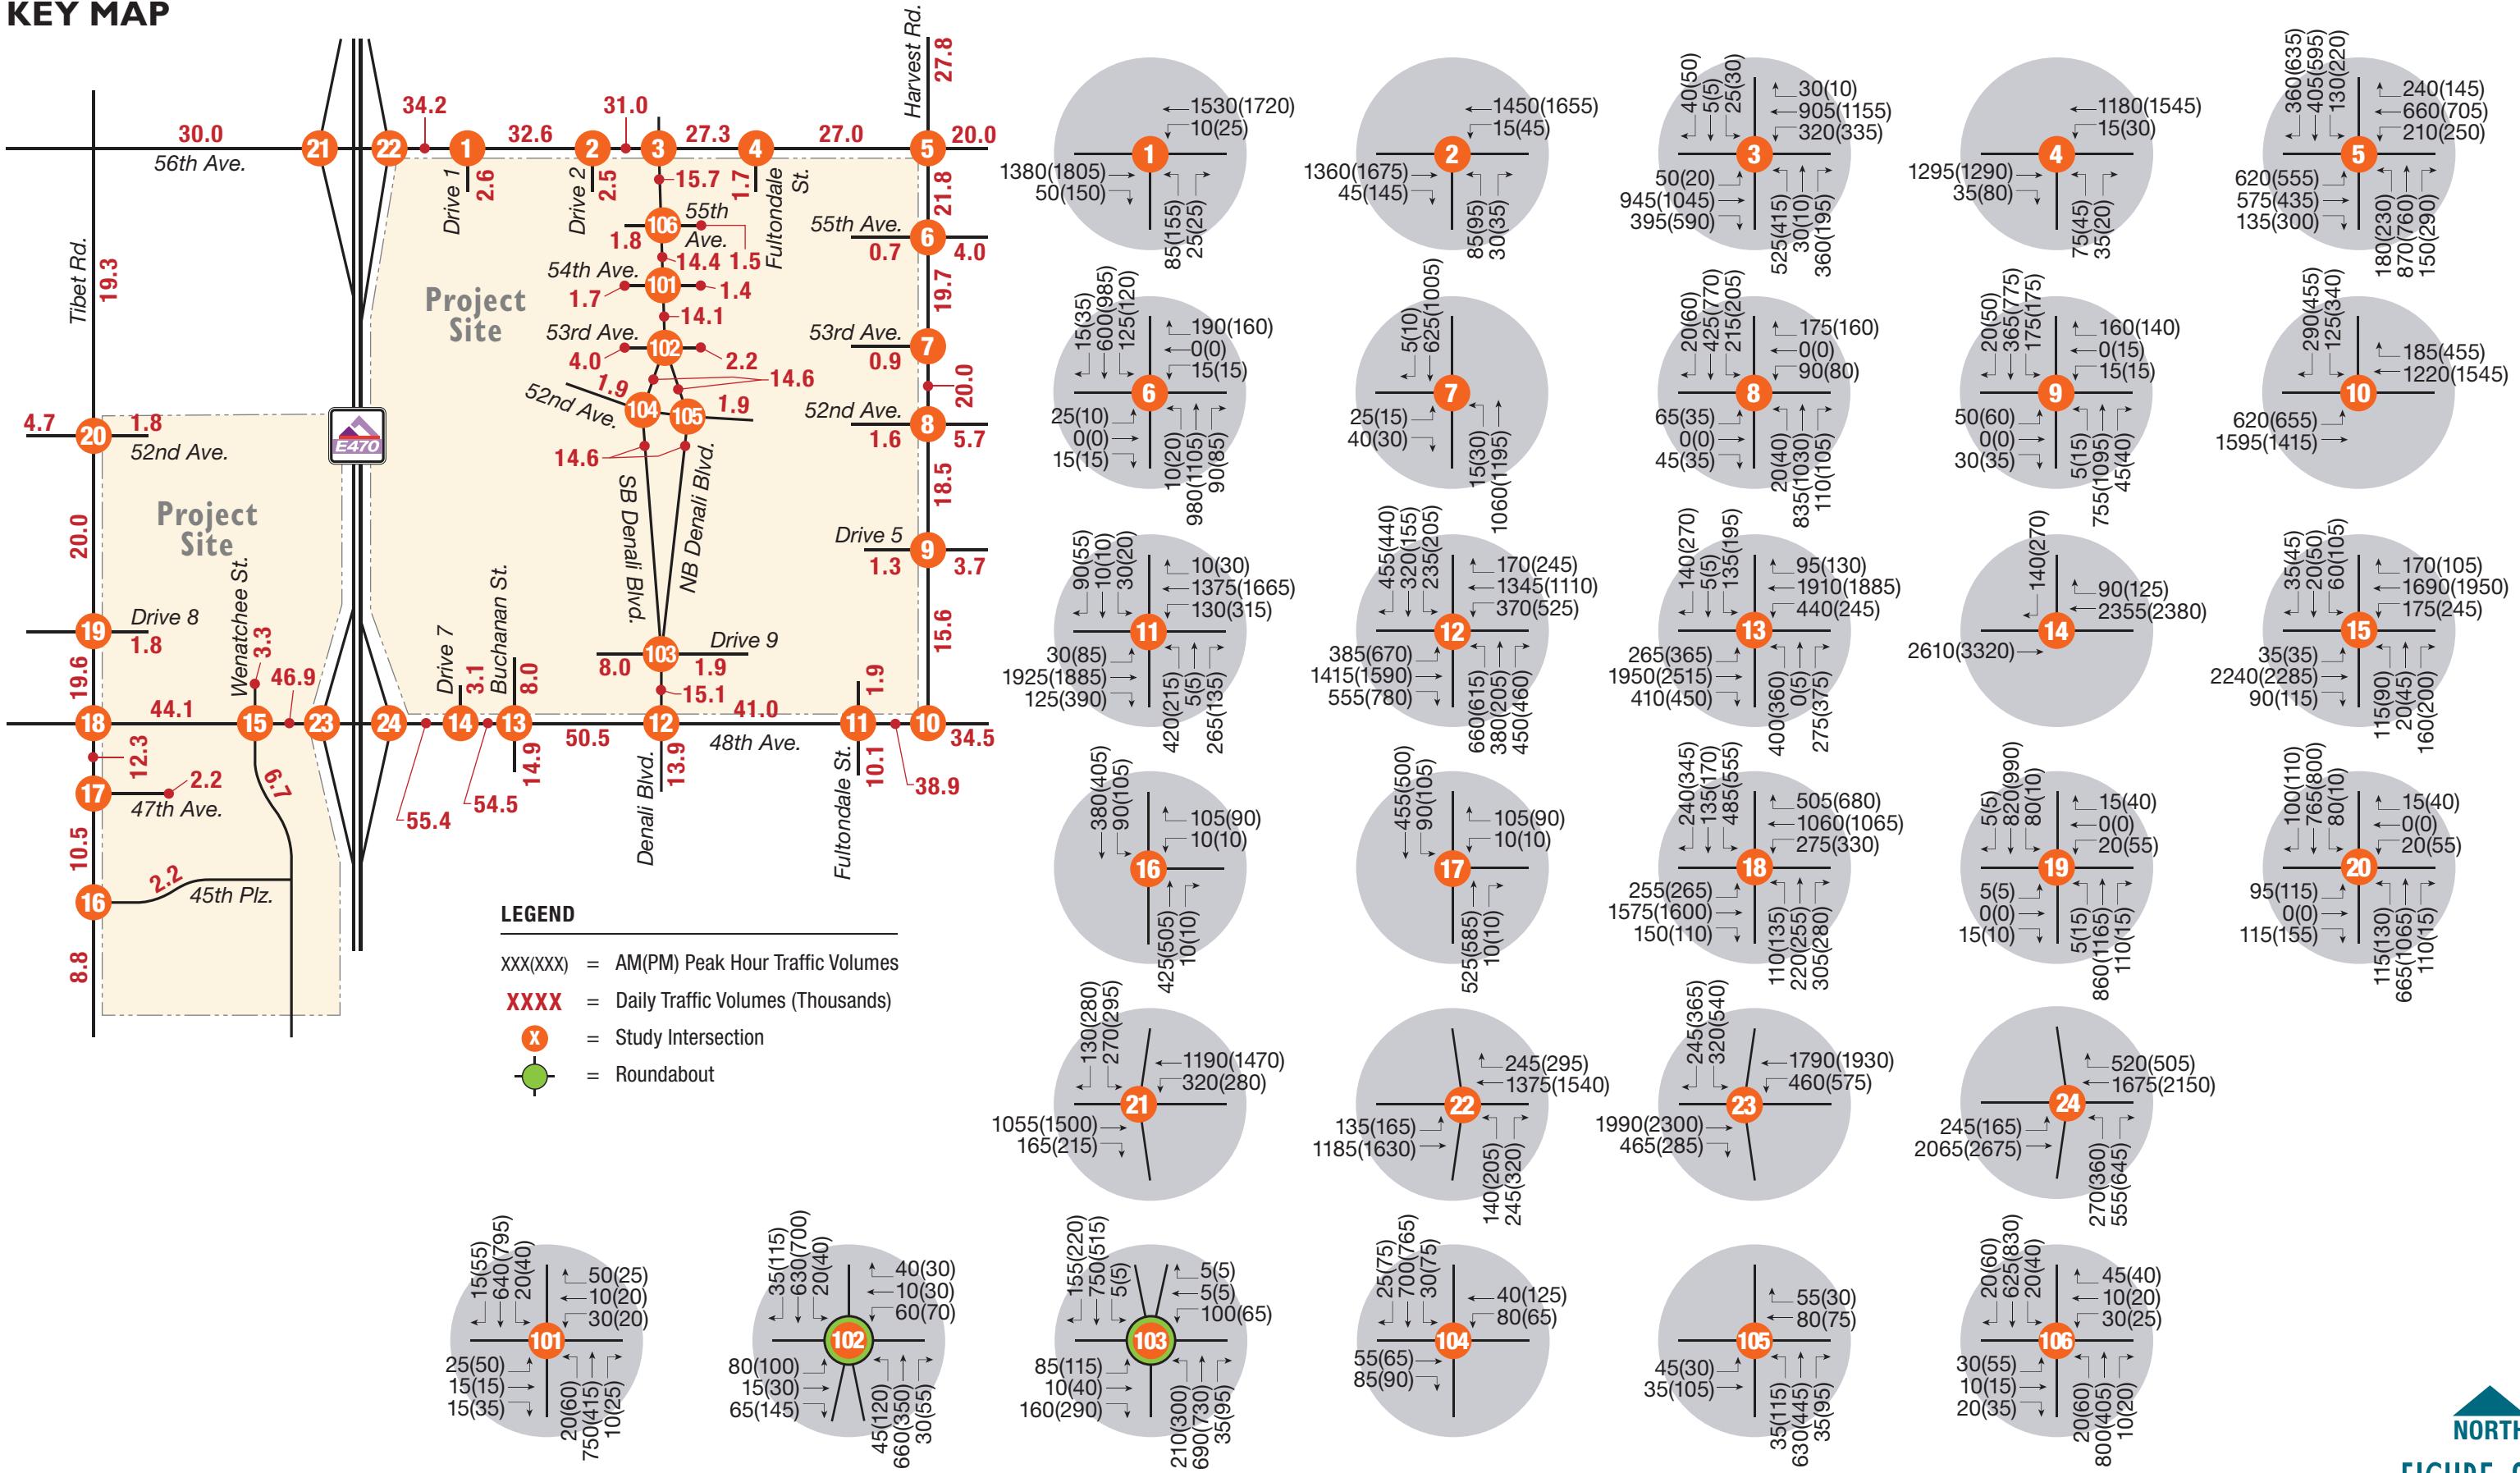

Harvest Road Operations & Conditions

A four-lane cross-section is anticipated to be constructed along Harvest Road. Left-turn and right-turn lanes were recommended based on SHAC requirements. All study intersections along Harvest Road are expected to operate at LOS D or better during the AM and PM peak hours. At stop-controlled intersections along Harvest Road, all movements are anticipated to operate at LOS D or better except for the eastbound and westbound shared left/through movements at the intersections Harvest Road with 55th Avenue (ID #6) and Drive 5 (ID #9).

Tibet Road Operations & Conditions

A four-lane cross-section is anticipated to be constructed along Tibet Road, north of 48th Avenue. A three-lane cross section is proposed to be constructed Tibet Road, south of 48th Avenue. Left-turn and right-turn lanes were recommended based on SHAC requirements. The signalized intersections in the study area along Tibet Road are anticipated to operate at LOS D or better during the peak periods. All movements at the stop-controlled intersections along Tibet Road are anticipated to operate at LOS D or better during the peak hours except for the westbound left-turn movement at the intersection of Tibet Road with Drive 8 (ID # 19) during the PM peak hour. It should be noted that the westbound left-turn volumes at the intersection of 48th Avenue with Tibet Road are close to meeting thresholds for a dual left-turn, however the three-lane cross-section being constructed along Tibet Road, south of 48th Avenue, does not provide the geometry necessary to capture dual left-turn lanes.

Future Total (2040)
Lane Geometry and Level of Service

V.C. Traffic Control Devices

The majority of site accesses are projected to function at acceptable levels with unsignalized traffic control in the 2040 buildout scenario. However, some site access points, and several perimeter roadway intersections are anticipated to meet signalization warrants upon buildout. The *Manual on Uniform Traffic Control Devices* (MUTCD) identifies eight warrants that provide guidance in determining whether a traffic signal installation might be justified. Some of these warrants are based on traffic volume levels, while others are based on the accident history of an intersection or whether the intersection is a designated school crossing. Warrant 1 (Eight Hour Vehicular Volume) and Warrant 2 (Four Hour Vehicular Volume) from the MUTCD have been applied here in assessing the appropriateness for signalization at study area intersections. From other studies that FHU has prepared in the area, a factor of 5.71 percent has been used and applied to the peak hour traffic as a means of estimating the 8th highest hour. This factor assumes that 10% of the daily traffic occurs during the peak hour. The 2nd through 7th highest hours were determined through linear interpolation of the peak hour and 8th highest hour traffic, which were then assessed with respect to Traffic Signal Warrants 1 and 2. The procedure outlined above provides a reasonable set of data in which to assess future signalization potential.

Each site access not anticipated to meet signalization warrants would need a STOP sign exiting the site. Traffic control within the Windler site would be unsignalized, including two roundabouts along Denali Boulevard at 53rd Avenue and Drive 9 which also mark the north and south endpoints of the boulevard section of Denali Boulevard that include a large greenspace between north and south travel lanes.

By 2040 the following intersections are anticipated to meet signalization warrants

- #1 – 56th Avenue with Drive 1
- #2 – 56th Avenue with Drive 2
- #3 – 56th Avenue with Denali Boulevard
- #5 – 56th Avenue with Harvest Road
- #8 – 52nd Avenue with Harvest Road
- #10 – 48th Avenue with Harvest Road
- #11 – 48th Avenue with Fultondale Street
- #12 – 48th Avenue with Denali Boulevard
- #13 – 48th Avenue with Buchanan Street
- #15 – 48th Avenue with Wenatchee Street
- #18 – 48th Avenue with Tibet Street
- #20 – Tibet Street with 52nd Avenue
- #21 – 56th Avenue with E-470 SB Ramps
- #22 – 56th Avenue with E-470 NB Ramps
- #23 – 48th Avenue with E-470 SB Ramps
- #24 – 48th Avenue with E-470 NB Ramp

Traffic conditions should be periodically monitored to determine the timing of traffic control improvements. Details of the MUTCD signalization warrants can be found in **Appendix F**.

V.D. Queuing and Auxiliary Lane Requirements

Recommendations for vehicle storage lengths at each of the external study area intersections are included in **Tables 4-8** for use in identifying construction needs for the Windler site. These dimensions represent the storage space necessary to meet the 95th percentile maximum queue during either the AM or PM peak hour.

Output from the traffic analysis effort was used to recommend these storage lengths, using the following methodology:

- **Left turn lane storage lengths.** At signalized intersections, the greater of the HCM 6th Edition or Synchro methodology queue calculations were reported. For unsignalized intersections, the HCM 6th Edition calculation was reported.
- **Through movements.** For signalized intersections, Synchro calculation results were reported. No through movement queues are reported for unsignalized intersections as the through movements are free.
- **Right turn movements.** The Synchro queue length was used. HCM 6th Edition information was not used because HCM's signalized intersection methodology does not account for right turns on red.

Deceleration lane and taper lengths should be added to these dimensions per the City of Aurora standards to identify the total length of each auxiliary lane. Upon the development of site plans, more detailed traffic impact studies should be prepared to confirm/refine the above queue lengths as well as all the study area intersection operations.

*shared lane **dual turn lane SHAC values based on a HV% of ten percent.

- 95th percentile volume exceeds capacity; queues may be longerm - volume for 95th percentile queue is metered by upstream signal

V.E. Transit Network

NEATS states that a well-developed transit system, properly related to the development patterns and land uses within the NEATS study area, will provide travelers with an effective alternative to single-occupancy vehicles. The reduction in single-occupancy vehicle use will help reduce congestion and improve air quality within the surrounding region.

NEATS identifies a proposed transit network, including a series of mobility hubs that will anchor transit routes that serve major employment and population areas. The network is designed to allow a systematic transition from traditional fixed route bus services and park-n-rides to a comprehensive transit system, including high frequency fixed transit routes and on-demand transit services linked with mobility hubs.

As identified in NEATS, while RTD is operating traditional fixed route bus service, the envisioned service plan for the transit routes is outlined below:

- 1 to 2-mile route spacing along major arterials.
- All routes connect to a park-n-ride, FasTracks station and/or mobility hub.
- Most routes would meet RTD's "Suburban Local" classification with at least 20 riders boarding on average per hour.
- All routes would have 15-minute peak hour services and at least 60-minute off peak service.
- The possible ridership for each route would range from 170 to 2,400 rides per day based on comparable existing service ridership.

NEATS has identified the following high frequency transit routes surrounding the Windler site:

- Along 56th Avenue from the western NEATS boundary at Tower Road extending east to Imboden Road.
- Along 48th Avenue from Picadilly Road extending east to Powhaton Road.
- Along Harvest Road from 48th Avenue extending north to the northern NEATS boundary at 72nd Avenue.

Additionally, NEATS identifies a Type I Mobility Hub planned for the southeast corner of Windler at the intersection of 48th Avenue and Harvest Road. Features of a Type I Mobility Hubs at intersections include but are not limited to:

- Enhanced bus stops with real time information
- Designated bus lanes and priority signals
- Secure bike parking
- Car sharing
- Off-street bike paths
- Public art
- A transit/community information kiosk

V.F. Bicycle and Pedestrian Network

NEATS states that a safe and connected walking and biking network is the cornerstone of the mobility system. The proposed network of trails along drainageways, bike lanes, and sidewalks will allow people of all ages and abilities to safely travel to and from their destinations. The network includes on and off-street travel ways that people can use for commuting, recreation, exercise, and short personal trips.

The network of bicycle and pedestrian facilities is designed for people who are traveling by foot or using a variety of e-motorized and non-motorized vehicles. This network includes facilities along roadway corridors and along drainageways. The range of facilities includes the following: sidewalks, shared-use paths, off-street trails, on-street bike lanes and buffered bike lanes, and protected or separated bike lanes. This network will provide the flexibility to serve pedestrians, bicycles, small e-vehicles, skateboarders, and other non-motorized vehicles that will emerge in the future. This walk and wheel accessible network will work in conjunction with the roadway and transit networks to provide safe access within neighborhoods and around the study area. In this context, the recommended bicycle and pedestrian network from the NEATS Refresh study creates a “complete street” system of multimodal facilities along the arterial and collector roadway grid in the study area.

Pedestrian and bicycle facilities identified in the NEATS Refresh study surrounding the Windler site include:

Primary Bike Routes (Separated bike lanes and Trails):

- Along 56th Avenue from the western NEATS boundary at Tower Road extending east to Imboden Road
- Along 48th Avenue from Picadilly Road extending east to Powhaton Road
- Along Harvest Road from 48th Avenue extending north to the northern NEATS boundary at 72nd Avenue

Secondary Bike Routes (Buffered or Separated bike lanes):

- Along Denali Boulevard from 38th Avenue extending north to 56th Avenue
- Along Tibet Street from 38th Avenue extending north to 64th Avenue

Trails

- The E-470 along the westside of E470 along the east side of E-470 through the entire NEATS study area from Jewell Avenue extending north to 72nd Avenue.
- A Connector Trail branching off of the secondary bike route along Denali Boulevard within the Windler site extending north to the Second Creek drainage near the northern NEATS boundary at 72nd Avenue, including an Enhanced At-Grade Crossing at 56th Avenue.

Midblock Pedestrian Crossings

- Midblock crossings are not generally needed along the Denali Boulevard and local street network of Windler as block lengths are less than 600 feet and vehicle speeds are expected to be low.
- Two midblock crossing locations are proposed along Denali Boulevard. The first location is between 55th Avenue (ID #106) and 54th Avenue (ID #101) and the second location is north of Drive 9 (ID # 103) to provide pedestrian and bicycle connectivity through the development.
- Signing and crosswalk marking should be provided at these locations. Enhanced treatments such as a rectangular rapid flashing beacons (RRFB) may be implemented if pedestrian traffic and safety support a need for one.

VI. CONCLUSIONS AND RECOMMENDATIONS

The approximate 852-acre Windler Homestead site would consist of 3,310 units of single-family housing, 2,185 multifamily units, 648,900 square feet of retail space, 290,000 square feet of office space, 2.2 million square feet of industrial/warehousing space, and a 300-student elementary school. The proposed development would generate approximately 88,699 vehicle trips per day, with approximately 5,454 and 8,226 trips during the AM and PM peak hours, respectively. The potential impacts of the site-generated traffic were evaluated under Long-Range Future (2040) scenarios. The following summarizes the findings and recommendations of this analysis.

The recently updated NEATS Refresh identifies the planned classification and laneage of the surrounding street system. The NEATS study was a key resource in preparing this traffic impact study. Some key revisions to the roadway network based on the findings of traffic studies conducted by City of Aurora and for nearby development:

1. Fulenwider Harvest Mile TIS – Eliminated Denali Boulevard between 56th Avenue and 60th Avenue. This break in connectivity reduces projected volumes and allows for the classification of Denali Boulevard to be downgraded to a collector roadway through the Windler Homestead site instead of a four-lane arterial.
2. The City of Aurora study on the alignment of Aerotropolis Parkway – The study proposes a connection to Jackson Gap Street from Powhaton Road instead of the previous proposal to connect to Harvest Road. This realignment results in a significant reduction in projected volumes on Harvest Road adjacent to the site resulting in the recommendation for a four-lane arterial instead of the previously proposed six-lane arterial.
3. Green Valley Ranch East TIS – Analysis indicated volumes along Tibet Street south of 48th Avenue do not support the previously proposed four-lane arterial, and the recommended cross-section was downgraded to a three-lane collector between 38th Avenue and 48th Avenue.

Roadway Improvement Recommendations:

- 56th Avenue is anticipated to be constructed as a six-lane cross-section with left-turn lanes provided at full-access points. Per the SHAC, right-turn lanes are generally not required at intersections along six-lane cross sections and therefore were not recommended except for an eastbound right-turn lane at the intersection of 56th Avenue with Denali Boulevard (ID #3) to improve traffic operations and safety.
- 48th Avenue is anticipated to be constructed as a six-lane cross-section with left-turn lanes provided at full-access points. As noted above, the SHAC does not require right-turn lanes at intersections along a six-lane cross sections. Right-turn lanes were recommended at intersections based on traffic volumes anticipated. These are summarized in further detail in the section below.
- A four-lane cross-section is recommended to be constructed along Harvest Road. Left-turn and right-turn lanes were recommended based on SHAC requirements.
- A four-lane cross-section should be constructed along Tibet Road, north of 48th Avenue. A three-lane cross section is proposed on Tibet Road, south of 48th Avenue. Left-turn and right-turn lanes were recommended based on SHAC requirements.
- Denali Boulevard should be constructed as a four-lane, median divided street. It is proposed that a one-way couplet be provided through the middle of Denali Boulevard between Drive 9 (ID #103) and 53rd Avenue (ID #102). The proposed cross section of each couplet is a single lane with on-street parking and bike lanes. Roundabouts are proposed to be constructed at either end of the couplets to allow for safe and effective traffic operations.
- Two-lane local streets should be constructed internally within the Windler development.

Intersection Improvement Recommendations:

The following improvements would be required for the 2040 background conditions, regardless of the development of Windler Homestead:

- Install a traffic signal at intersection #3 – 56th Street with Denali Boulevard. A westbound left-turn lane and a dedicated eastbound left-turn lane should be provided.
- Install a traffic signal at intersection #5 – 56th Street with Harvest Road. Dual eastbound left-turn lanes and a dedicated northbound right-turn lane should be provided.
- At the stop-controlled intersection #6 – Harvest Road with 55th Avenue, a southbound left-turn lane and northbound right-turn lane should be provided.
- Install a traffic signal at intersection #8 – Harvest Road with 52nd Avenue. A southbound left-turn and northbound right-turn lane should be provided.
- At the stop-controlled intersection #9 – Harvest Road with Drive 5, a southbound left-turn lane and northbound right-turn lane should be provided.
- Install a traffic signal at intersection #10 – 48th Street with Harvest Road. Dual eastbound left-turn lanes and a dedicated westbound right-turn lane should be provided. The southbound approach should provide dual left-turn lanes and a right-turn lane.
- Install a traffic signal at intersection #11 – 48th Street with Fultondale Street. Dual westbound left-turn lanes and a dedicated eastbound right-turn lane should be provided. The northbound approach should provide dual left-turn lanes and a right-turn lane.
- Install a traffic signal at intersection #12 – 48th Street with Denali Boulevard. An eastbound and westbound left-turn lane and dedicated westbound right-turn lane should be provided. The northbound approach should provide dual left-turn lanes and a dedicated right-turn lane. The southbound approach should provide a single left-turn lane and a dedicated right-turn lane.
- Install a traffic signal at intersection #13 – 48th Street with Buchanan Street. Dual westbound left-turn lanes and a dedicated eastbound right-turn lane should be provided. The northbound approach should provide dual left-turn lanes and a right-turn lane.
- Install a traffic signal at intersection #15 – 48th Avenue with Wenatchee Street. Dedicated left-turn lanes should be provided on all approaches of the intersection.
- Install a traffic signal at intersection #18 – 48th Avenue with Tibet Road. Dedicated right-turn lanes should be provided on all approaches of the intersection. Dual left-turn lanes should be provided on the southbound approach.
- Install a traffic signal at intersection #20 – Tibet Road with 52nd Avenue. A dedicated northbound left-turn lane and a southbound right-turn lane should be provided.

The following improvements are a requirement of the Windler Homestead development based upon impacts of site generated traffic:

- Install a traffic signal at intersections #1 – 56th Street with Drive 1 and #2 – 56th Street with Drive 2. A westbound left-turn lane and a two-lane northbound approach with a left-turn and right-turn lane should be provided.
- Dual westbound left-turn lane should be provided at intersection #3 – 56th Street with Denali Boulevard upon buildout of the site.
- Provide a westbound left-turn lane and a two-lane northbound approach with a left-turn and right-turn lane at intersection #11 – 56th Avenue with Fultondale Street.
- Provide a northbound left-turn and southbound right-turn lane at intersection #6 – Harvest Road with 55th Avenue. The eastbound approach out of the site should provide a two-lane approach with a shared left/through lane and a dedicated right-turn lane.

- Provide a northbound left-turn lane at intersection #8 – Harvest Road with 52nd Avenue. The eastbound approach out of the site should provide a two-lane approach with a left-turn lane and a shared through/right-turn lane.
- Provide a northbound left-turn and southbound right-turn lane at intersection #9 – Harvest Road with Drive 5. The eastbound approach out of the site should provide a two-lane approach with a shared left/through lane and a dedicated right-turn lane.
- Provide an eastbound left-turn lane and a southbound two-lane approach with a dedicated left-turn lane and shared through/right-turn lane at intersection #11 – 48th Avenue with Fultondale Street.
- Dual eastbound left-turn lanes and an eastbound right-turn lane should be provided upon buildout at intersection #12 – 48th Street with Denali Boulevard.
- Provide dual eastbound left-turn lanes and three-lane southbound approach with a dedicated left-turn, though, and right-turn lane at intersection #13 – 48th Street with Buchanan Street.
- Provide a right-in right-out (RIRO) access at intersection #14 – 48th Avenue with Drive 7. A westbound right-turn lane should be provided.
- Provide two-way stop controlled (TWSC) access at intersections #16 – Tibet Road with 45th Plaza and #17 – Tibet Road with 47th Avenue. Southbound left-turn lanes should be provided at the intersection via the proposed two-way left-turn lane (TWLTL).
- Provide a southbound left-turn and northbound right-turn lane at intersection #19 – Tibet Road with Drive 8. The westbound approach out of the site should provide a two-lane approach with a shared left/through lane and a dedicated right-turn lane.
- Provide a southbound left-turn and northbound right-turn lane at intersection #20 – Tibet Road with 52nd Avenue. The westbound approach out of the site should provide a two-lane approach with a dedicated left-turn lane and a shared through/right-turn lane.

Residential	2%	2%
Hotel	N/A	N/A

¹Land Use Codes (LUCs) from *Trip Generation Manual*, published by the Institute of Transportation Engineers.

²Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

³Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

⁴Enter vehicle occupancy assumed in Table 1-A vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made to Tables 5-A, 9-A (O and D). Enter transit, non-motorized percentages that will result with proposed mixed-use project complete.

⁵Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-A.

⁶Person-Trips

*Indicates computation that has been rounded to the nearest whole number.

Project Name:	Windler TIA
Analysis Period:	AM Street Peak Hour

¹Land Use Codes (LUCs) from *Trip Generation Manual*, published by the Institute of Transportation Engineers.

²Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

³Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

⁴Enter vehicle occupancy assumed in Table 1-P vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made.

⁵Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-P.

⁶Person-Trips

*Indicates computation that has been rounded to the nearest whole number.

Project Name:	Windler TIA
Analysis Period:	PM Street Peak Hour

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
