Executive Summary

Metro Center is a proposed mixed-use, transit-oriented development in Aurora, Colorado, south of Alameda Avenue/Parkway between Sable Boulevard and Chambers Road. Several evaluations of traffic conditions have been completed to assess the anticipated transportation impacts of the proposed site.

The Metro Center Master Plan Amendment would alter the proposed development by removing a segment of Dawson Street between Alameda Avenue and Centrepoint Drive and replacing the alignment with a bicycle and pedestrian throughway. This traffic impact study (TIS) has been prepared to evaluate anticipated transportation impacts of this amendment and to consider several other changes that have occurred to the Metro Center site since the previous study was approved for the original Master Plan in 2020.

Land uses proposed within Metro Center under the Master Plan Amendment would include:

- ▶ 2,130 multifamily dwelling units
- ▶ 49,880 square feet of commercial/mixed-use
- ▶ 3,500 square feet of office space

These land uses are expected to generate up to 14,060 daily trips, including about 1,040 in the morning peak hour and about 1,315 in the evening peak hour. However, with considerations of internal trip-making, pass-by trips, and mode share reductions, the site would generate about 9,485 net external daily vehicle trips, nearly 845 in the morning peak hour and 920 in the evening peak hour. The development would also generate about 860 internal daily vehicle trips, 20 in the morning peak hour and 48 in the evening peak hour.

The addition of these trips to the surrounding roadway network, as well as the anticipated regional growth of traffic (background traffic), would result in impacts to traffic operations that would fail to meet criteria established by Aurora's TIS guidelines. To mitigate these conditions, the following improvements should be considered:

- ▶ **To address existing traffic conditions and regional background traffic growth:**
 - Consider restricting left-turns at several signalized intersections to protected-only phasing during more times of day to address Approach Turn crashes.
 - Consider improving sight distance and signal visibility at several signalized intersections; also consider reviewing progression and clearance times at these intersections to address Broadside crash frequency.
 - Consider restricting southbound access at Alameda Avenue & Municipal Center Access to prohibit left-turns, with exceptions for emergency vehicles, to address Broadside crash frequency.
 - Adjust signal cycle lengths at Alameda Avenue/Parkway & Alameda Drive to match adjacent intersections.
 - Construct new northbound and westbound right-turn lanes and introduce overlap phases for both movements at Alameda Parkway & Chambers Road; also increase left-turn storage lengths for all four approaches.
 - Implement protected/permitted phasing for westbound left-turns at Exposition Avenue & Sable Boulevard (recently completed); also increase left-turn storage for the southbound approach.
 - Consider mitigations to improve sight distance for the westbound approach of Center Avenue & Chambers Road. Also consider signalization based on the Crash Experience warrant.

- Install signing that prohibits northbound U-turns at Exposition Avenue & Chambers Road; construct new eastbound and westbound left-turn lanes with protected/permitted phasing; construct a new southbound right-turn lane; and increase storage length for several turn lanes.
- Periodically review and adjust traffic signal timings to accommodate changing traffic patterns, including at intersections with light rail crossings.

► **To address new traffic generated by the proposed Metro Center development:**

- Implement protected/permitted phasing for westbound left-turns at Alameda Avenue/Parkway & Alameda Drive; increase storage for northbound left-turns at this intersection.
- Restripe the westbound approach at Centrepoint Drive & Sable Boulevard to provide dedicated left-turn, through, and right-turn lanes; increase storage for westbound left-turns.
- Construct a new traffic signal at Center Avenue & Chambers Road; provide protected/permitted phasing for northbound and southbound left-turns.
- Construct a new westbound left-turn lane at Alameda Parkway & Fraser Court.

I. Introduction

Metro Center is a proposed mixed-use development in Aurora, Colorado, on more than 60 acres, south of Alameda Parkway between Sable Boulevard and Chambers Road as shown on **Figure 1**. Currently, the Regional Transportation District (RTD) Aurora Metro Center Station occupies portions of the site near the intersection of Sable Boulevard & Centrepoint Drive and the Arapahoe County Centrepoint Plaza near the Alameda Parkway & Alameda Drive.

The *Aurora Metro Center Traffic Impact Study*¹ in 2020 (Metro Center Master TIS) previously addressed traffic impacts associated with the proposed Metro Center development. Staff at the City of Aurora approved this study to accompany the Master Plan application for Metro Center. Additional traffic analyses have been conducted to address changes to the Metro Center Master Plan related to land use types/sizes and site access.^{2,3}

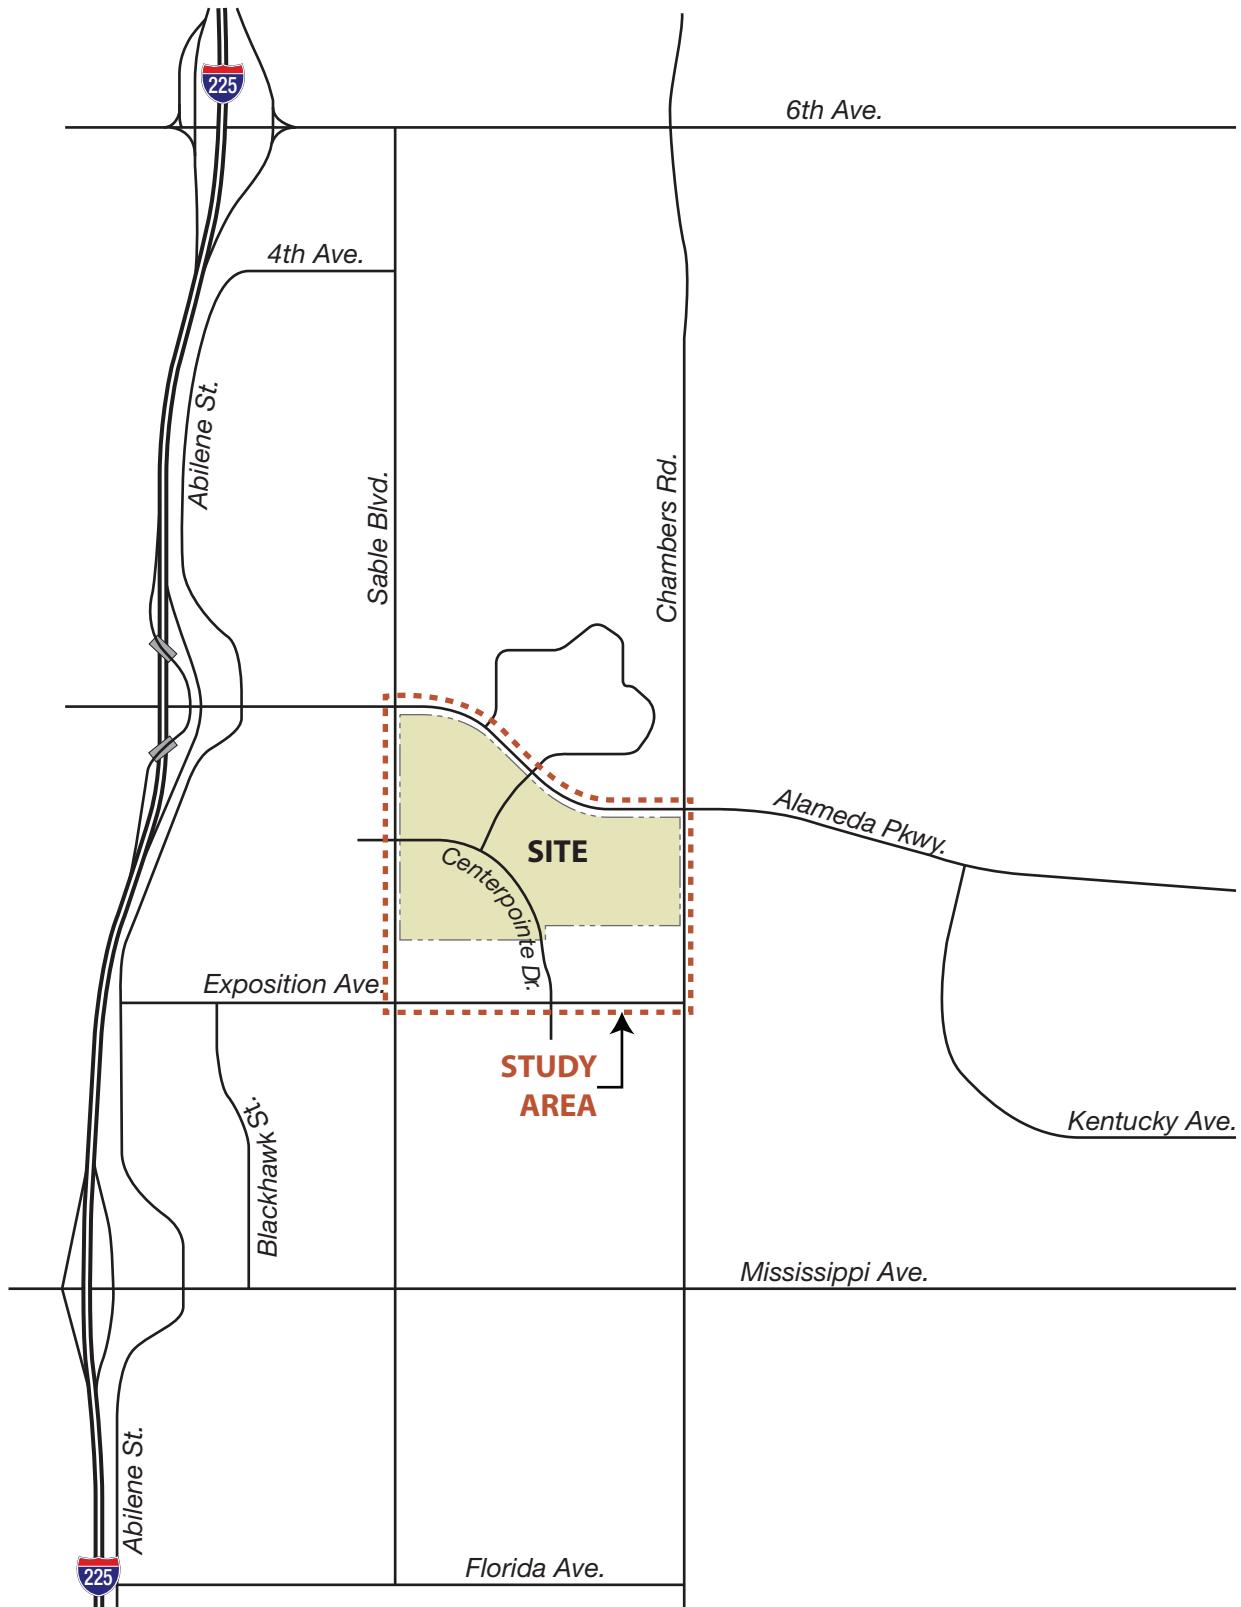

A new amendment to the Metro Center Master Plan that would alter the proposed roadway network and site access on the western half of the site is being submitted. This traffic impact study (TIS) has been prepared to reevaluate traffic impacts related to the proposed development considering the changes proposed in the Master Plan Amendment, as well as encompassing all other changes that have already been addressed. As such, the analyses, impacts, and recommendations documented in this TIS are intended to supersede all previous traffic analyses conducted for the proposed development. This TIS evaluates traffic impacts and potential mitigations in existing (Year 2024) conditions and a long-term (Year 2040) scenario representing a future planning horizon.

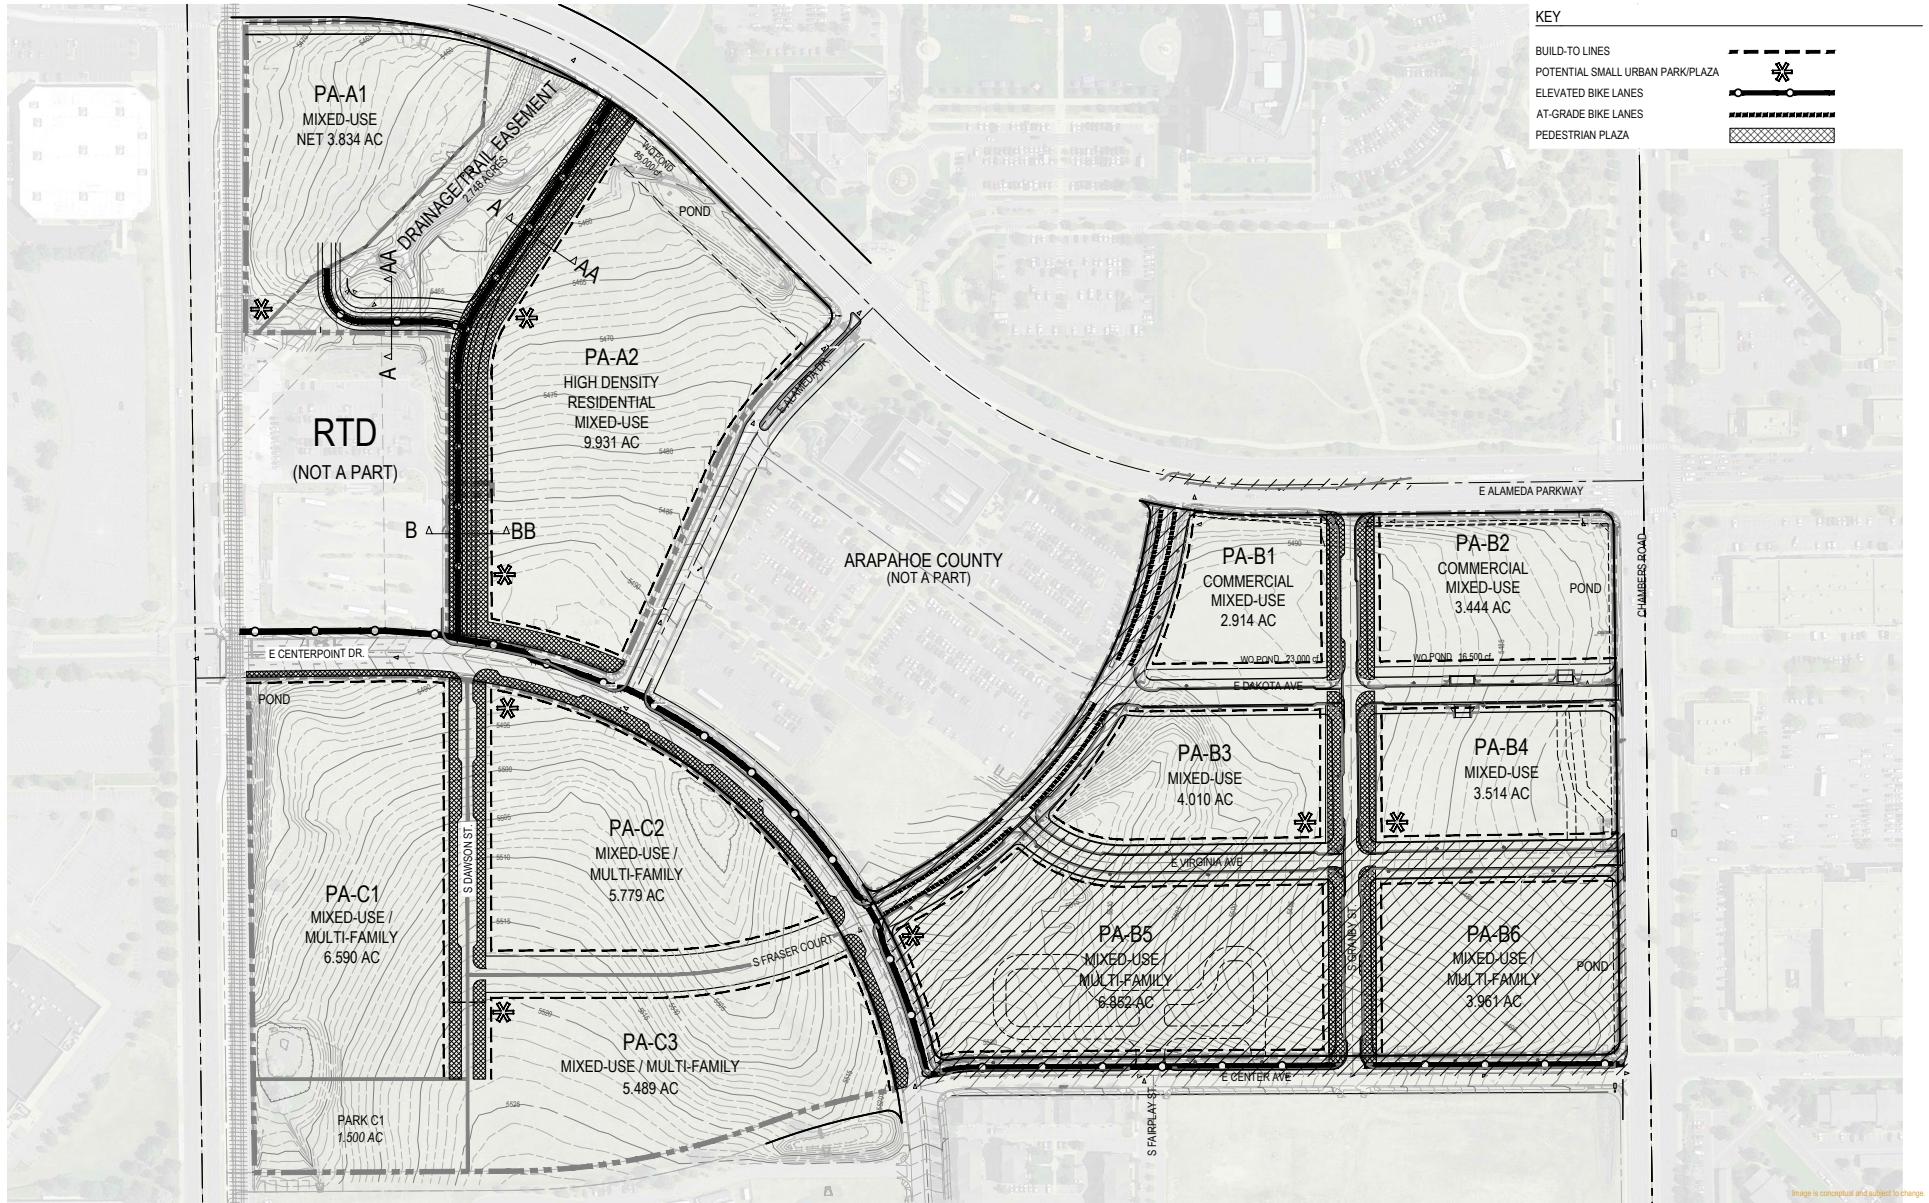

The current version of the proposed Metro Center development evaluated for this TIS envisions approximately 53 thousand square feet (KSF) of office and commercial uses (e.g., retail, dining, grocery) and 2,130 multifamily dwelling units (DUs). **Figure 2** displays a site plan for Metro Center under the Master Plan Amendment.

I.A Master Plan Amendment Changes

Compared to the *Metro Center Master TIS*, this study addresses the following major changes to the proposed roadway network within Metro Center as part of the Master Plan Amendment:

- ▶ **Dawson Street**, previously identified as a proposed north-south two-lane roadway, would connect from Fraser Court to Alameda Avenue adjacent to the RTD Aurora Metro Center Station and aligned with the unsignalized Municipal Center Access.
 - Under the Master Plan Amendment, the segment of Dawson Street from Centrepoint Drive to Alameda Avenue would no longer be constructed with vehicular access.
 - Instead, the Dawson Street alignment would serve as a bicycle and pedestrian throughway with allowances for emergency vehicle access.
- ▶ **Dakota Avenue**, previously identified as a proposed east-west two-lane roadway, would connect Dawson Street to Chambers Road, passing through the Arapahoe County property.
 - Under the Master Plan Amendment, the segment of Dakota Avenue from Dawson Street to Alameda Drive would not be constructed and the segment from Alameda Drive to Fraser Court would not provide vehicular access for through traffic.
- ▶ **Parcel A1** was previously identified to have access via a right-in/right-out (RIRO) only vehicular access to Alameda Avenue and a full-movement access at the Dakota Avenue & Dawson Street intersection.
 - Under the Master Plan Amendment, access via the Dawson Street alignment would be restricted to emergency vehicles only, and the RIRO access to Alameda Avenue would be the only public vehicular access point.
- ▶ **Parcels A2 and A3** were previously identified to be located between Dawson Street and Alameda Drive and bifurcated by Dakota Avenue.
 - Under the Master Plan Amendment, these parcels would be combined into a single parcel, Parcel A2. Access to this parcel would come from Alameda Drive.

II. Existing Conditions

II.A Land Use

The area surrounding the Metro Center site primarily consists of retail and office space to the west, north, and east and residential land uses to the south and southeast. Major developments in the vicinity include the Aurora Municipal Center (municipal building, library, and police department) on the north side of Alameda Parkway, Aurora Mall on the west side of Sable Boulevard, City Center Marketplace shopping center on the east side of Chambers Road, and a medical office building south of the site in the northeast corner of the Sable Boulevard & Exposition Avenue intersection. Multifamily residential developments exist south of the site east of Centrepoint Drive and east of Chambers Road. Other residential developments are located south of Exposition Avenue and east of Chambers Road.

The proposed development would surround the Arapahoe County Centrepoint Plaza facility, south of Alameda Parkway between Alameda Drive and Fraser Court. The RTD Aurora Metro Center Station is on the east side of Sable Boulevard north of Centrepoint Drive. The station includes bus and light rail service.

II.B Roadway Network and Study Intersections

Roadway Network

The existing roadway network within the study area consists of the following facilities:

Alameda Avenue/Alameda Parkway

Alameda Avenue/Parkway is a six-lane east-west arterial roadway. To the west, Alameda Avenue provides access to major commercial centers, including Aurora Mall and Aurora City Place, and to Interstate 225 (I-225). To the east, Alameda Parkway provides access to commercial and residential developments before turning south, becoming Tower Road at Mississippi Avenue. Railroad tracks for the RTD R Line cross Alameda Avenue at-grade on the east side of Sable Boulevard within the intersection area. The posted speed limit along Alameda Avenue/Parkway is 40 miles per hour (MPH).

Sable Boulevard

Sable Boulevard is a four-lane north-south roadway that parallels I-225 between 6th Avenue to the north and Iliff Avenue to the south. The RTD R Line crosses Sable Boulevard at-grade within the Exposition Avenue intersection and continues to parallel Sable Boulevard on its east side until it crosses Ellsworth Avenue north of the site. The posted speed limit on Sable Boulevard is 35 MPH.

Chambers Road

Chambers Road, a six-lane north-south arterial roadway, provides regional connectivity through the city of Aurora from 56th Avenue to the north to State Highway 83/Parker Road to the south. The posted speed limit on Chambers Road is 40 MPH.

Exposition Avenue

Exposition Avenue is a three-lane east-west collector roadway with median turn-lanes. West of the site, the RTD R Line is located in the median of Exposition Avenue before crossing at-grade at Sable Boulevard. Bicycle lanes are provided in both directions of Exposition Avenue from east of Sable Boulevard to Chambers Road. The posted speed limit on Exposition Avenue is 30 MPH.

Alameda Drive

Alameda Drive is a two-lane local road that connects Centrepoin Drive to Alameda Avenue/Parkway. North of Alameda Avenue/Parkway, Alameda Drive provides access to the Aurora Municipal Center. The posted speed limit on Alameda Drive is 30 MPH.

Centrepoin Drive

Centrepoin Drive is a three- to four-lane local road that connects Sable Boulevard to Exposition Avenue. Between Sable Boulevard and Alameda Drive, two travel lanes are provided in each direction. Between Alameda Drive and Exposition Avenue, one northbound lane, two southbound lanes, and a continuous two-way left-turn (TWLT) lane are provided. The posted speed limit on Centrepoin Drive is 30 MPH.

Center Avenue

Center Avenue, a two-lane east-west local road, connects Centrepoin Drive to Chambers Road. It also provides access to a multifamily residential development. No speed limit is posted on Center Avenue, but the roadway was analyzed with a speed limit of 30 MPH.

Study Intersections

In the original *Metro Center Master TIS*, 12 study intersections were identified for analysis in consultation with City of Aurora staff. The same 12 intersections were evaluated for this TIS:

1. Alameda Ave & Sable Blvd – **Signalized**
2. Alameda Ave & Municipal Center Access
3. Alameda Ave/Pkwy & Alameda Drive – **Signalized**
4. Alameda Pkwy & Chambers Rd – **Signalized**
5. Centrepoin Dr & Sable Blvd – **Signalized**
6. Exposition Ave & Sable Blvd – **Signalized**
7. Exposition Ave & Centrepoin Dr/Evanston St
8. Exposition Ave & Chambers Rd – **Signalized**
9. Center Ave & Chambers Rd
10. Walsh Dr & Centrepoin Dr
11. Center Ave & Centrepoin Dr
12. Centrepoin Dr & Alameda Dr

In addition to providing traffic signalization for vehicular movements, intersections 1, 5, and 6 also incorporate phases for light rail movements on the RTD R Line.

II.C Site Access

Some access locations to the proposed development already exist. Centrepoin Drive, Alameda Drive, and Center Avenue are all constructed. A curb cut that would be used for RIRO access to Parcel A1 has already been constructed along Alameda Parkway east of Sable Boulevard. Finally, existing RIRO access for the Arapahoe County Centrepoin Plaza building (Fraser Court) would also serve the proposed development.

II.D Traffic Volumes

For the original *Metro Center Master TIS*, traffic counts were conducted in September 2019 to understand daily and peak hour traffic conditions during typical weekdays. For this study, city staff requested that select intersections be recounted to provide an update on travel conditions post-pandemic. New morning and evening peak hour traffic counts were conducted in April 2024 at the following intersections:

1. Alameda Ave & Sable Blvd
3. Alameda Ave/Pkwy & Alameda Dr
4. Alameda Pkwy & Chambers Rd
5. Centrepoint Dr & Sable Blvd
9. Center Ave & Chambers Rd

Compared to data collected in 2019, new 2024 counts demonstrated similar traffic patterns but slight shifts in time of day:

- ▶ Morning Peak Hour
 - **2019:** 7:15 a.m. to 8:15 a.m.
 - **2024:** 7:15 a.m. to 8:15 a.m.
- ▶ Evening Peak Hour
 - **2019:** 4:30 p.m. to 5:30 p.m.
 - **2024:** 4:45 p.m. to 5:45 p.m.

Historic Traffic Count Comparison

Peak hours from 2024 were chosen for evaluation to represent the most recently available typical conditions.

Table I displays comparisons of peak hour traffic volumes, measured in vehicles per hour (VPH), between 2019 and 2024 by approach volume on each street at intersections with new counts.

Table I. Intersection Approach Volume Comparison

#	Intersection	Peak Hour	North-South Volume (VPH)			East-West Volume (VPH)		
			2019	2024	Delta	2019	2024	Delta
1	Alameda Ave & Sable Blvd	a.m.	892	854	- 4%	3,035	2,915	- 4%
		p.m.	1,456	1,380	- 5%	3,011	3,138	+ 4%
3	Alameda Ave/Pkwy & Alameda Dr	a.m.	75	77	+ 3%	3,009	2,996	- 0%
		p.m.	297	228	- 23%	3,035	3,138	+ 3%
4	Alameda Pkwy & Chambers Rd	a.m.	2,890	2,609	- 10%	2,667	2,973	+ 11%
		p.m.	3,347	3,446	+ 3%	2,764	3,093	+ 12%
5	Centrepoint Dr & Sable Blvd	a.m.	723	775	+ 7%	151	128	- 15%
		p.m.	1,162	1,103	- 5%	388	386	- 1%
9	Center Ave & Chambers Rd	a.m.	2,927	2,570	- 12%	148	91	- 39%
		p.m.	3,162	3,182	+ 1%	144	107	- 26%

As shown in **Table I**, changes in traffic peak hour traffic volumes vary by location and time of day. East-west volumes along Alameda Parkway in 2024 exhibited marginal decreases during the morning peak hour compared to those of 2019, but slight increases during the evening peak hour. An exception to this is at the

Alameda Parkway & Chambers Road (#4) intersection, where east-west volumes in 2024 increased by 11–12 percent during peak hours compared to those of 2019. This could be attributed to changes in signal timing that increase capacity for east-west traffic.

North-south traffic volumes along Sable Boulevard in 2024 exhibited marginal decreases during morning and evening peak hours compared to those of 2019, except at the Centrepoint Drive & Sable Boulevard (#5) intersection, where 2024 volumes increased by 7 percent during the AM peak hour. North-south traffic volumes along Chambers Road in 2024 exhibited notable decreases during the morning peak hour compared to those of 2019 (10–12 percent), and slight increases during the evening peak hour (1–3 percent).

Traffic volumes on minor streets near the Metro Center site (Alameda Drive, Centrepoint Drive, Center Avenue) exhibited the most change between 2019 and 2024 count periods:

- ▶ North-south traffic on Alameda Drive decreased by 23 percent during the evening peak hour compared to 2019 volumes.
 - This is likely attributed to less office activity at the Aurora Municipal and Arapahoe County facilities.
- ▶ East-west traffic on Centrepoint Drive decreased by 15 percent during the morning peak hour compared to 2019 volumes.
 - This could also be attributed to less activity at Aurora Mall, the RTD Aurora Metro Center Station, or the Arapahoe County facility.
- ▶ East-west volumes on Center Avenue decreased by 26–39 percent during morning and evening peak hours compared to 2019 volumes.
 - Center Avenue was closed to through traffic between Centrepoint Drive and Chambers Road during data collection in 2024, which accounts for much of the decrease in volume.
 - Decreased activity on the east side of Chambers Road could also contribute to lower east-west traffic volumes.

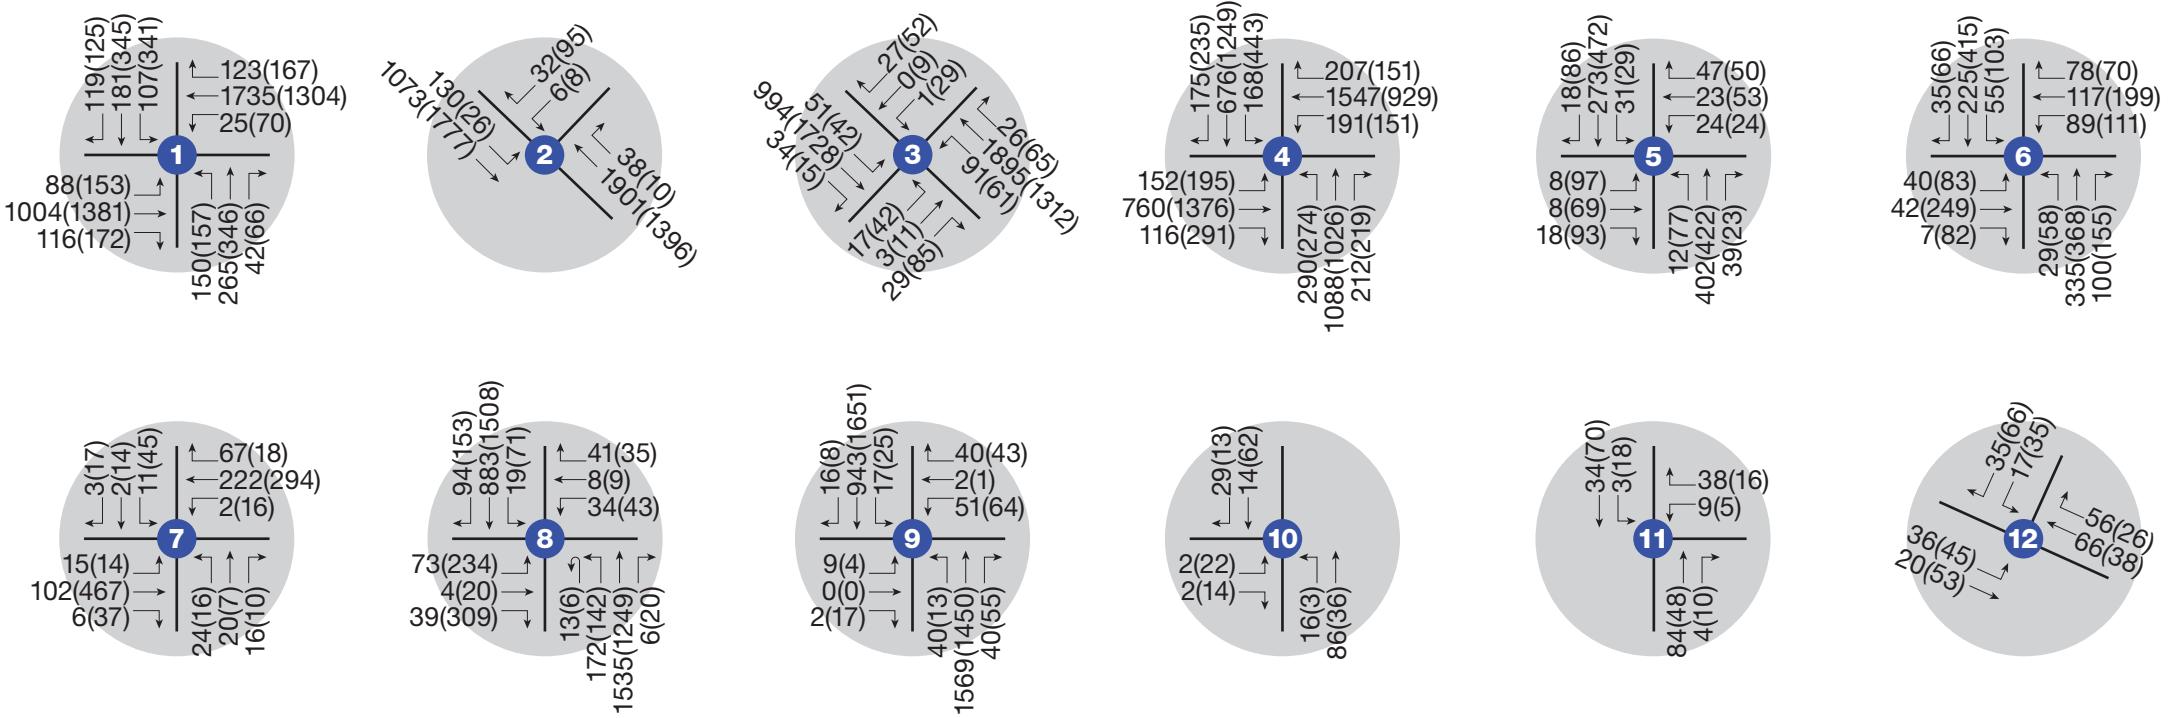

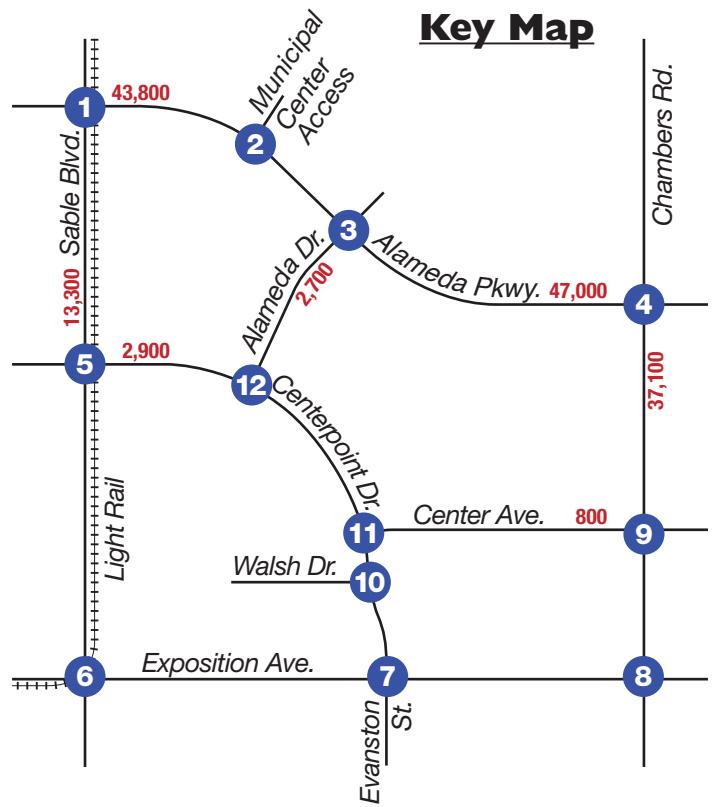

2024 Existing Traffic Volumes

Traffic counts from 2019 at other intersections within the study area were adjusted using similar factors to the comparisons shown in **Table I** to develop a full set of traffic volumes representing 2024 conditions. Because of the closure of Center Avenue from Centrepoint Drive to Chambers Road, 2019 counts were used to estimate peak hour volumes for the eastbound approach of the Center Avenue & Chambers Road (#9) intersection. **Figure 3** displays estimates of existing (2024) daily and peak hour traffic volumes within the Metro Center study area based on new 2024 counts and other traffic data from 2019.

As shown on **Figure 3**, Alameda Avenue/Parkway currently serves between 43,800 and 47,000 vehicles per day (VPD) along the frontage of the proposed development, including an average of 3,050 VPH during the morning peak hour and 3,275 VPH during the evening peak hour.

South of Alameda Avenue, Sable Boulevard serves 13,300 VPD, including approximately 800 VPH during the morning peak hour and 1,150 VPH during the evening peak hour. Alameda Drive serves 2,700 VPD, including approximately 175 VPH during the morning peak hour and 225 VPH during the evening peak hour. Chambers Road serves 37,100 VPD, including approximately 2,575 VPH during the morning peak hour and 3,200 VPH during the evening peak hour.

East of Sable Boulevard, Centrepoint Drive serves 2,900 VPD, including approximately 175 VPH during the morning peak hour and 250 VPH during the evening peak hour. West of Chambers Road, Center Avenue serves 800 VPD, including approximately 75 VPH during the morning peak hour and 50 VPH during the evening peak hour.

NOTE: Drawing Not to Scale

II.E Traffic Operations

Methodology

Traffic operations within the study area were evaluated according to techniques documented in the *Highway Capacity Manual, 7th Edition* (HCM) using Trafficware's Synchro software (version 11). Existing traffic volumes and intersection geometry were used to evaluate operations. Traffic signal timing data from the previous Metro Center Master TIS were also used in this study to evaluate traffic operations.

Peak hour factors (PHFs), which are used to account for the variation of traffic arrivals within a peak hour, were calculated for each approach of all study intersections. Like the previous Metro Center Master TIS, PHFs for all future year scenarios were adjusted to the average of the existing factor and 0.92, recognized by HCM as a default value. Unsignalized intersections within the study area considered the impacts of upstream traffic signals, which meter traffic flow and provide additional gaps for movements from the minor street approaches.

Level of Service (LOS) is a qualitative measure of traffic operational conditions based on roadway capacity and vehicle delay. LOS is described by a letter designation ranging from A to F, with LOS A representing almost free-flow travel, while LOS F represents congested conditions. LOS is reported as an average for the entire intersection at signalized locations, and by movement for stop sign-controlled intersections (for movements that yield right-of-way).

TIS guidelines established by the City of Aurora indicate that for signalized intersections, peak hour traffic operations should be at LOS D or better, though individual movements at signalized intersections may be allowed to operate at LOS E. Individual unsignalized movements can operate at LOS E or LOS F if there is low traffic demand or viable alternate routes.

Light Rail At-Grade Crossing Intersections

In the Metro Center Master TIS, exceptions to the HCM methodology were used to evaluate the Alameda Avenue & Sable Boulevard (#1), Centrepoint Drive & Sable Boulevard (#5), and Exposition Avenue & Sable Boulevard (#6) intersections due to impacts of RTD light rail activity. This study also considered the use of hold phases to stop all traffic for a light rail crossing and Synchro LOS to evaluate these intersections.

As noted in the Metro Center Master TIS, this methodology results in conservative estimates of traffic operations since the actual signal controller can incrementally adjust green time for all phases to accommodate a light rail call, but Synchro can only take green time away from the coordinated major street phases. In reality, intersections along Sable Boulevard may operate at a better LOS than what is presented in this study.

Long-term traffic signal timing improvements to Sable Boulevard intersections in the study area have been evaluated in this TIS but may require coordination with the Colorado Public Utilities Commission (PUC) for approval. Physical improvements, such as construction of new turn lanes, would also require coordination with the PUC to begin a formal application process.

Existing Level of Service

Table 2 summarizes existing LOS at all study area intersections based on 2024 traffic volumes, and **Figure 4** shows existing LOS and lane configurations. As indicated, all signalized intersections currently operate at LOS D or better during peak hours. Most unsignalized movements operate at LOS D or better.

Although all signalized intersections currently operate at LOS D or better, some movements operate at LOS F during one or more peak hour, which does not meet Aurora's criteria for signalized traffic operations:

- ▶ **Alameda Parkway & Chambers Road (#4):** Westbound through and right-turn movements during the morning peak hour.

- ▶ **Exposition Avenue & Sable Boulevard (#6):** Westbound left-turn movements during the evening peak hour.
- ▶ **Exposition Avenue & Chambers Road (#8):** Eastbound left-turn and through movements, westbound left- and right-turn movements during the evening peak hour.

Unsignalized southbound left-turn movements at the Alameda Avenue & Municipal Center Access (#2) intersection operate at LOS F during both peak hours.

Table 2. Existing Intersection Level of Service

#	Signalized Intersection		Morning Peak Hour	Evening Peak Hour
#	Stop-Controlled Intersection	Movement	Morning Peak Hour	Evening Peak Hour

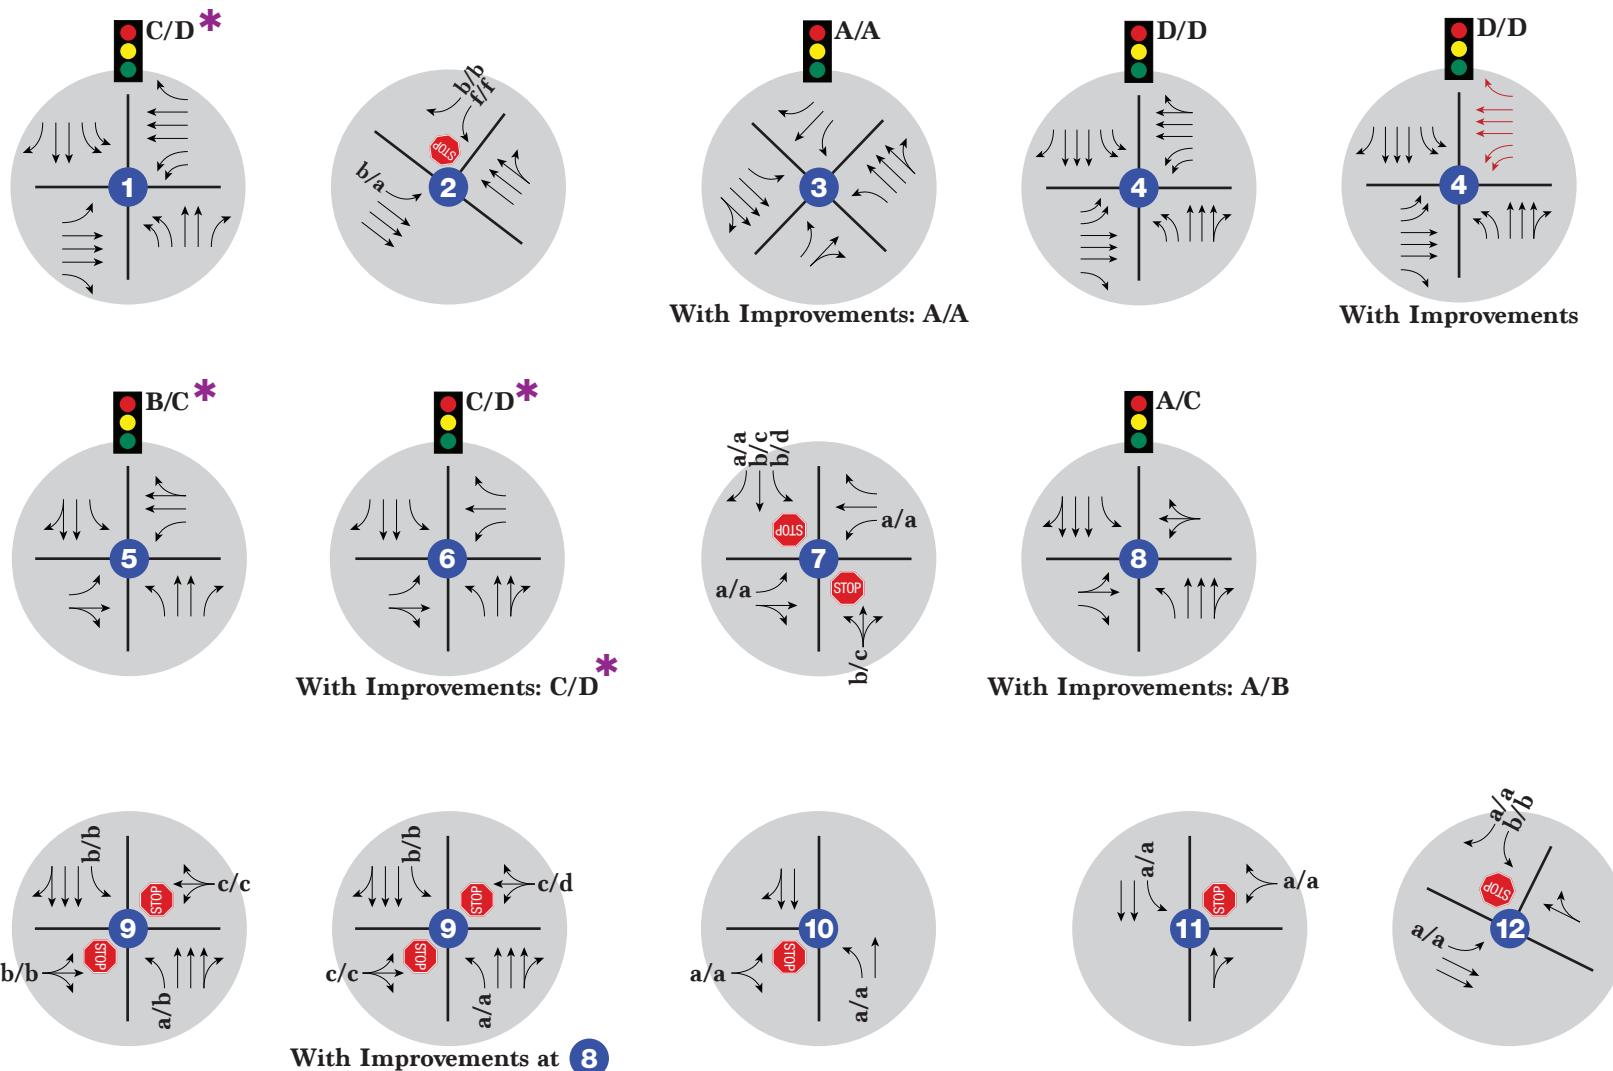

FIGURE 4
Existing
Traffic Conditions

Recommended Mitigations

To mitigate substandard LOS experienced during existing conditions, the City of Aurora should consider implementing the following roadway and traffic signal improvements, sorted by intersection reference number.

2. Alameda Avenue & Municipal Center Access

Although southbound left-turns at the Alameda Avenue & Municipal Center Access (#2) intersection operate at LOS F during peak hours, no mitigation is recommended. This movement serves light traffic demand (less than 10 VPH during peak hours) and alternate routes are available via Alameda Drive.

3. Alameda Avenue/Parkway & Alameda Drive

Based on available traffic signal timing data, the Alameda Avenue/Parkway & Alameda Drive (#3) intersection uses a 90-second cycle length during the evening peak hour, which does not match the 135-second cycle used at the Alameda Parkway & Chambers Road (#4) intersection, a quarter mile to the east. The city should consider increasing the cycle length to 135 seconds, which would improve progression along Alameda Avenue/Parkway but would not significantly hinder intersection operations. The Alameda Avenue/Parkway & Alameda Drive (#3) intersection would continue to operate at LOS A during both peak hours.

4. Alameda Parkway & Chambers Road

Existing counts indicate that during the morning peak hour, approximately 1,750 westbound motorists make through or right-turn movements at the Alameda Parkway & Chambers Road (#4) intersection, resulting in oversaturated traffic flow and LOS F conditions. The city should consider constructing a dedicated westbound turn lane to serve the high volume right-turn movement and providing an overlap phase concurrent with southbound left-turns. Right-of-way constraints may limit the feasibility of this improvement. With a new westbound right-turn lane and overlap phase, the intersection would operate at LOS D during peak hours, but no movements would fall below LOS E conditions.

6. Exposition Avenue & Sable Boulevard

Based on signal timing data used in the *Metro Center Master TIS*, the westbound left-turn movement operates with permitted-only phasing (green ball). As a result, this movement operates at LOS F during the evening peak hour. A dedicated left-turn phase should be added for westbound Exposition Avenue, and westbound left-turns should operate with protected/permitted phasing. With this improvement, the intersection would continue to operate at LOS C/D during morning/evening peak hours, respectively.

Field review of the intersection indicates that this improvement has already been made since signal timing was last provided for the *Metro Center Master TIS*.

8. Exposition Avenue & Chambers Road

Northbound U-turn movements limit capacity of eastbound right-turns at the Exposition Avenue & Chambers Road (#8) intersection based on evaluation techniques from the HCM, resulting in excessive queues for the eastbound approach. Aurora should consider implementing signing explicitly prohibiting U-turns and allowing the eastbound right-turn overlap phase to operate more efficiently. With this improvement, the intersection could operate at LOS A/B during morning/evening peak hours, respectively.

Although westbound movements operate at LOS F during the evening peak hour, several alternate routes to Chambers Road are available approximately 300 feet south of Exposition Avenue and at Ohio Avenue/Ada Place. Therefore, no additional mitigations are recommended for existing conditions.

II.F Safety Conditions

At the request of City of Aurora staff, the team conducted a brief safety analysis to evaluate existing conditions for the study area intersections along arterial roadways, including:

1. Alameda Ave & Sable Blvd
2. Alameda Ave & Municipal Center Access
3. Alameda Ave/Pkwy & Alameda Dr
4. Alameda Pkwy & Chambers Rd
5. Centrepoint Dr & Sable Blvd
6. Exposition Ave & Sable Blvd
7. Exposition Ave & Chambers Rd
9. Center Ave & Chambers Rd

Methodology

The goal of this safety analysis is to determine the magnitude of and nature of existing safety problems using data-driven techniques and statistical analyses. Safety Performance Functions (SPFs) were used to evaluate the magnitude of safety problems, while Direct Diagnostic techniques were used to assess the nature of safety problems.

Data Collection

The team used DiExSys' Vision Zero Suite (VZS) to collect historic crash data for the study intersections identified previously. VZS aggregates all crash data collected by the Colorado Department of Transportation (CDOT) and provides safety analyses using methods from the Highway Safety Manual (HSM). VZS crash data was collected for the period from 2018–2022, which represents the most recently available five-year period.

Average annual daily traffic (AADT) volume data was collected along arterial roads using CDOT sources for use in evaluating safety performance with respect to traffic volume. Because the AADTs shown in this section are based on an average of conditions recorded during the 2018–2022 crash data, they do not necessarily match the daily traffic volumes shown in **Section II.D**.

Safety Performance Functions

SPFs were used to assess the magnitude of existing intersection safety problems. The SPF reflects the relationship between traffic exposure, measured in AADT, and crash frequency, measured in crashes per year. The SPF models provide an estimate of the expected crash frequency and severity for a range of AADT among similar intersection types. Two kinds of SPFs were used: the first addresses the total crash frequency, while the second considers the frequency of crashes involving an injury or a fatality (severe crashes).

Level of Service of Safety

Development of SPFs leads to the conceptual formulation of the Level of Service of Safety (LOSS). The concept of level of service uses qualitative measures that characterize safety of a roadway segment in reference to its expected performance. The expected crash frequency predicted by the SPF represents an expected level of safety, and specified percentiles of the SPF can be stratified to represent levels of safety with respect to the expected crash frequency. LOSS boundaries are calibrated by computing the 20th and the 80th percentiles using the Gamma Distribution Probability Density Function, resulting in the following LOSS descriptions:

- ▶ **LOSS I:** Below 20th Percentile
 - Indicates low potential for crash reduction.
- ▶ **LOSS II:** 20th Percentile to Mean
 - Indicates low-to-moderate potential for crash reduction.

- ▶ **LOSS III:** Mean to 80th Percentile
 - Indicates moderate-to-high potential for crash reduction.
- ▶ **LOSS IV:** Above 80th Percentile
 - Indicates high potential for crash reduction.

LOSS reflects an intersection's performance with respect to expected crash frequency and severity at a specific level of AADT. It does not provide any information related to the nature of the safety problem itself. If the safety problem is present, LOSS describes only its magnitude from the frequency and severity standpoint.

Correcting for Regression to the Mean Bias

The average of several years of crash history of an intersection provides an estimate of what is likely to be observed in the future. The precision of this estimate, however, can be improved by correcting for the Regression to the Mean (RTM) bias. RTM reflects the tendency for random event occurrences, such as crashes, to move toward the average during an experiment or over time. For instance, if an intersection exhibits unusually high or unusually low crash frequency in a particular year, RTM bias recognizes that over the long run the true average is closer to the mean representing safety performance of similar intersections.

RTM bias is addressed using the Empirical Bayes (EB) method. The EB method combines the known crash history with information regarding the safety of similar intersection types using the expected crash frequency and over-dispersion parameter associated with the SPF. EB-corrected values of frequency and severity of crashes are used in the SPF analysis to assess the magnitude of the existing safety problems.

Direct Diagnostics

While SPFs and LOSS describe the magnitude of safety problems, Direct Diagnostics were used to understand the nature of existing safety problems related to crash types, environmental conditions, and driver conditions. Direct Diagnostics compare the distribution of crashes observed at an intersection to distribution of data used in the formation of SPFs for similar intersection types. Using the binomial distribution, the team evaluated each crash type and contributing factor to determine if the frequency of occurrence at a study intersection was significantly greater than the frequency observed at similar intersections. Crash types and contributing factors with at least five occurrences and exceeding the 95 percent confidence level of the binomial distribution are considered a diagnostic pattern.

Safety Analysis Results

Table 3 summarizes the crash history for the selected study intersections. As shown, the Alameda Avenue & Sable Boulevard (#1) intersection experienced the most crashes over the five-year period (126), over 45 percent of which resulted in injury. This intersection experienced crash frequency consistent with LOSS IV conditions, indicating high potential for crash reduction. The Alameda Parkway & Chambers Road (#4) intersection had the second most crashes over the study period (70); however, this intersection experienced LOSS II (Total) and LOSS III (Severe) conditions.

Other intersections experienced LOSS IV conditions, indicating moderate-to-high potential for crash reduction. The Centrepoint Drive & Sable Boulevard (#5) intersection experienced severe crash frequency consistent with LOSS IV conditions, while the Center Avenue & Chambers Road (#9) intersection experienced total crash frequency consistent with LOSS IV conditions.

One fatal crash was recorded at the study intersections, occurring at the Centrepoint Drive & Sable Boulevard (#5) intersection. This crash involved a southbound motorcyclist fleeing the scene of a different crash who rear ended another motorist and then collided with a tree.

The following subsections describe in further detail the existing safety conditions for each select study intersection. **Appendix D** includes additional crash history data and safety analyses.

Table 3. Select Intersection Crash History (2018–2022)

#	Intersection	Crash Severity				LOSS		Notable Patterns
		PDO	INJ	FAT	Total	Total	Severe	
1	Alameda Ave & Sable Blvd	69	57	0	126	IV	IV	Pedestrian Approach Turn Dark-Lighted
2	Alameda Ave & Municipal Center Access	9	1	0	10	II	II	Broadside
3	Alameda Ave/Pkwy & Alameda Dr	9	10	0	19	I	II	Broadside
4	Alameda Pkwy & Chambers Rd	46	24	0	70	II	III	Broadside
5	Centrepoint Dr & Sable Blvd	12	8	1	21	III	IV	Broadside
6	Exposition Ave & Sable Blvd	8	11	0	19	II	III	Approach Turn
8	Exposition Ave & Chambers Rd	13	13	0	26	II	II	Approach Turn
9	Center Ave & Chambers Rd	21	5	0	26	IV	III	Broadside

Notes: PDO: Property Damage Only, INJ: Injury, FAT: Fatal, LOSS: Level of Service of Safety

I. Alameda Avenue & Sable Boulevard

Major Street: Alameda Avenue

AADT: 35,400 VPD

Minor Street: Sable Boulevard

AADT: 14,600 VPD

Classification: Urban Six-Lane Divided Signalized Four-Leg Intersection

Crash History: 126 Total (57 Injury)

LOSS: IV (Total), IV (Severe)

Diagnostic Patterns: Pedestrian, Approach Turn, Dark-Lighted

Pedestrian crashes represented about 4 percent of the crash history (5 of 126); two times higher than the typical rate for similar intersections. All five crashes involved motorists making turning movements and resulted in injury to the pedestrian(s). Over half of crashes (3 of 5) occurred during Dark-Lighted conditions.

Approach Turn crashes represented about 53 percent of the crash history (66 of 126); three times higher than the typical rate for similar intersections. Over half of the Approach Turn crashes (36 of 66) resulted in injury.

Approach Turn crashes most commonly involved southbound (23 of 66), eastbound (19 of 66), and northbound (16 of 66) left-turning motorists. Less than half of Approach Turn crashes occurred during dawn, dusk, or dark conditions (25 of 66). Twenty-three of 66 Approach Turn crashes occurred during morning and evening peak periods (7–9 a.m. and 4–6 p.m.)

Dark-Lighted crashes represented about 31 percent of the crash history (39 of 126); about one-third higher than the typical rate for similar intersections. Dark-Lighted crash types primarily included Approach Turns (20 of 39). Rear End, Broadside, Fixed Object, Pedestrian, Sideswipe, and Overtaking Turn crashes were also recorded.

Preliminary Recommendations:

- ▶ Review left-turn operations for all directions, especially for southbound, eastbound, and northbound approaches.
- ▶ Consider using flashing yellow arrow (FYA) operations to restrict left-turn phases to protected-only during more times of day, especially morning and evening peak periods.
- ▶ Review lighting conditions at the intersection, on all approaches, and at the pedestrian level.

2. Alameda Avenue & Municipal Center Access

Major Street: Alameda Avenue

AADT: 35,400 VPD

Minor Street: Municipal Center Access

AADT: 3,500 VPD (10% of Major Street)

Classification: Urban Six-Lane Divided Unsignalized Three-Leg Intersection

Crash History: 10 Total (1 Injury)

LOSS: II (Total), II (Severe)

Diagnostic Patterns: Broadside

Broadside crashes represented 80 percent of the crash history (8 of 10); nearly four times higher than the typical rate for similar intersections. One crash resulted in injury. All eight Broadside crashes involved a southbound left-turning motorist colliding with a westbound motorist. Most of the Broadside crashes (6 of 8) occurred between 2 p.m. and 7 p.m. Driver Inexperience or Preoccupation was cited in half of the crashes (4 of 8).

Preliminary Recommendations:

- ▶ Consider restricting access to prohibit southbound left-turns from the Municipal Center Access.
 - This may not be feasible due to the proximity to the Aurora Police Department, but the intersection could be designed to permit southbound left-turns for emergency vehicles only.

3. Alameda Avenue/Parkway & Alameda Drive

Major Street: Alameda Avenue/Parkway

AADT: 35,400 VPD

Minor Street: Alameda Drive

AADT: 3,500 VPD (10% of Major Street)

Classification: Urban Six-Lane Divided Signalized Four-Leg Intersection

Crash History: 19 Total (10 Injury)

LOSS: I (Total), II (Severe)

Diagnostic Patterns: Broadside

Broadside crashes represented about 37 percent of crashes (7 of 19); about three times higher than the typical rate for similar intersections. Most Broadside crashes resulted in injuries (5 of 7) and involved westbound motorists on Alameda Parkway. Over half of the crashes occurred between 1 p.m. and 6 p.m.

Preliminary Recommendations:

- ▶ Consider reviewing/correcting interval clearance timings (yellow & all red) and corridor progression to reduce red-light running.
- ▶ Consider mitigations that improve signal visibility such as:
 - Removing sight distance obstructions (like landscaping)

- Placing signal heads on the mast arms above each lane
- Adding reflective backplate tape on signal heads
- Installing near-side signal heads for traffic on curves of Alameda Avenue/Parkway
- Adding advance warning signs and beacons

4. Alameda Parkway & Chambers Road

Major Street: Alameda Parkway

AADT: 31,500 VPD

Minor Street: Chambers Road

AADT: 28,300 VPD

Classification: Urban Six-Lane Divided Signalized Four-Leg Intersection

Crash History: 70 Total (24 Injury)

LOSS: II (Total), III (Severe)

Diagnostic Patterns: Broadside

Broadside crashes represented about 20 percent of crashes (14 of 70); about two times higher than the typical rate for similar intersections. Half of the Broadside crashes resulted in injuries (7 of 14) and nearly half occurred during Dark-Lighted conditions. Most Broadside crashes involved northbound and southbound at-fault drivers, and northbound motorists were the most involved overall. All Broadside crashes occurred between 11 a.m. and midnight or between midnight and 5 a.m.

Preliminary Recommendations:

- ▶ Consider reviewing/correcting interval clearance timings (yellow & all red) and corridor progression to reduce red-light running.
- ▶ Consider mitigations that improve signal visibility such as:
 - Adding reflective backplate tape on signal heads
 - Maintaining signal lenses and visors to reduce sun glare
 - Adding advance warning signs and beacons

5. Centrepoint Drive & Sable Boulevard

Major Street: Sable Boulevard

AADT: 14,600 VPD

Minor Street: Centrepoint Drive

AADT: 2,900 VPD (20% of Major Street)

Classification: Urban Four-Lane Divided Signalized Four-Leg Intersection

Crash History: 21 Total (8 Injury, 1 Fatal)

LOSS: III (Total), IV (Severe)

Diagnostic Patterns: Broadside, Snow/Sleet/Hail

Broadside crashes represented about 52 percent of crashes (11 of 21); nearly four times higher than the typical rate for similar intersections. Nearly half of the Broadside crashes resulted in injuries (5 of 11) and most involved northbound and southbound at-fault drivers. All crashes with southbound motorists occurred between approximately 6 a.m. and 2 p.m.; all crashes with northbound motorists occurred between approximately 2 p.m. and 7 p.m.

Preliminary Recommendations:

- ▶ Consider reviewing/correcting interval clearance timings (yellow & all red) and corridor progression to reduce red-light running.
- ▶ Consider mitigations that improve signal visibility such as:
 - Adding reflective backplate tape on signal heads
 - Maintaining signal lenses and visors to reduce sun glare
 - Adding advance warning signs and beacons

6. Exposition Avenue & Sable Boulevard

Major Street: Sable Boulevard

AADT: 14,600 VPD

Minor Street: Exposition Avenue

AADT: 6,300 VPD

Classification: Urban Four-Lane Divided Signalized Four-Leg Intersection

Crash History: 19 Total (11 Injury)

LOSS: II (Total), III (Severe)

Diagnostic Patterns: Approach Turn

Approach Turn crashes represented about 37 percent of the crash history (7 of 19); over two times higher than the typical rate for similar intersections. Over half of the Approach Turn crashes (4 of 7) resulted in injury. Approach Turn crashes most commonly involved westbound (4 of 7) and northbound (2 of 7) left-turning motorists, with most (5 of 7) occurring between 1 p.m. and 7 p.m.

Preliminary Recommendations

- ▶ Review left-turn operations for all directions, especially for westbound and northbound approaches.
 - Westbound left-turns were recently modified to provide a protected phase with a flashing yellow arrow (FYA).
- ▶ Consider using FYA operations to restrict left-turn phases to protected-only during more times of the day, especially during afternoons and evenings.

8. Exposition Avenue & Chambers Road

Major Street: Chambers Road

AADT: 28,300 VPD

Minor Street: Exposition Avenue

AADT: 6,300 VPD

Classification: Urban Six-Lane Divided Signalized Four-Leg Intersection

Crash History: 26 Total (13 Injury)

LOSS: II (Total), II (Severe)

Diagnostic Patterns: Approach Turn

Approach Turn crashes represented about 31 percent of the crash history (8 of 26); nearly two times higher than the typical rate for similar intersections. Less than half of Approach Turn crashes (3 of 8) resulted in injury and most commonly involved northbound (4 of 8) and southbound (3 of 8) left-turning/U-turning motorists. Most crashes (6 of 8) occurred between 11 a.m. and 7 p.m.

Preliminary Recommendations:

- ▶ Review left-turn operations for all directions, especially for northbound and southbound approaches.
- ▶ Consider replacing “doghouse” style left-turn signals with FYA signals and restricting left-turn phases to protected-only during specific times of day, especially during afternoons and evenings.

9. Center Avenue & Chambers Road

Major Street: Chambers Road

AADT: 28,300 VPD

Minor Street: Center Avenue

AADT: 2,800 VPD (10% of Major Street)

Classification: Urban Six-Lane Divided Unsignalized Four-Leg Intersection

Crash History: 26 Total (5 Injury)

LOSS: IV (Total), III (Severe)

Diagnostic Patterns: Broadside

Broadside crashes represented about 77 percent of crashes (20 of 26); over two times higher than the typical rate for similar intersections. Only 5 of the 20 Broadside crashes resulted in injuries. Most Broadside crashes occurred between westbound and northbound motorists (11 of 20) or between westbound and southbound motorists (6 of 20). Nearly all Broadside crashes occurred between 7 a.m. and 9 p.m.

Of the 20 Broadside crashes, 8 occurred in a one-year period between March 2019 to February 2020, meeting the requirement of the Crash Experience warrant for traffic signalization in the Manual on Uniform Traffic Control Devices (MUTCD). Similarly, 17 Broadside crashes occurred in a three-year period from July 2018 to June 2021, which also meets the MUTCD criteria.

Preliminary Recommendations:

- ▶ Consider mitigations that improve sight distance from westbound Center Avenue, such as removing or trimming landscaping.
- ▶ Consider traffic signalization based on MUTCD Warrant 5 – Crash Experience if criteria for Warrant I – Eight-Hour Vehicular Volume are also met.

III. Proposed Conditions

III.A Project Description

As evaluated in the *Metro Center Master TIS*, the proposed Metro Center development evaluated for the Master Plan Amendment would occupy the site bounded by Sable Boulevard to the west, Alameda Parkway to the north, Chambers Road to the east, and Center Avenue to the south. This TIS assumes that Metro Center would include the following land uses across the entire site:

- ▶ 2,130 multifamily DUs
- ▶ 49.88 KSF commercial/mixed-use
- ▶ 3.5 KSF office space

The RTD Aurora Metro Center Station and the Arapahoe County Centrepoint Plaza would remain.

III.B Proposed Roadway Network and Study Intersections

Roadway Network

Modifications and additions to the proposed roadway network within the study area and project site would consist of the following facilities.

Dakota Avenue

Dakota Avenue would be constructed as a two-lane east-west local street that connects Fraser Court to Chambers Road south of Alameda Parkway. At Fraser Court, Dakota Avenue would be aligned with access to the Arapahoe County property. The intersection of Chambers Road & Dakota Avenue would be restricted to RIRO movements only.

Virginia Avenue

Virginia Avenue would be constructed as a two-lane east-west local street that connects Fraser Court to Chambers Road north of Center Avenue. At Chambers Road, Virginia Avenue would be aligned with access to the City Center Marketplace shopping center. The intersection of Chambers Road & Virginia Avenue would be restricted to RIRO movements only. The existing southbound left-turn lane would remain.

Center Avenue

Center Avenue would remain as a two-lane local roadway.

Dawson Street

Dawson Street would be constructed as a two-lane north-south local street between Fraser Court and Centrepoint Drive. North of Centrepoint Drive, the Dawson Street alignment would serve as a bicycle and pedestrian throughway with allowances for emergency vehicle access.

Alameda Drive

Alameda Drive would remain as a two-lane local roadway adjacent to the Arapahoe County property. Dedicated turn lanes at the Centrepoint Drive & Alameda Drive (#12) intersection would be removed.

Fraser Court

Fraser Court would be a two-lane primarily north-south local street east of the Arapahoe County Centrepoint Plaza property. It would connect Alameda Parkway to Dawson Street and have intersections with Dakota Avenue, Virginia Avenue, and Centrepoint Drive. The intersection of Alameda Parkway & Fraser Court would be a three-quarter movement access, allowing left-turns and right-turns in from Alameda Parkway but only right-turns out from Fraser Court.

Granby Street

Granby Street would be a two-lane north-south local street connecting Alameda Parkway to Center Avenue. The intersection of Alameda Parkway & Grandby Street would be restricted to RIRO movements only.

Centrepoint Drive

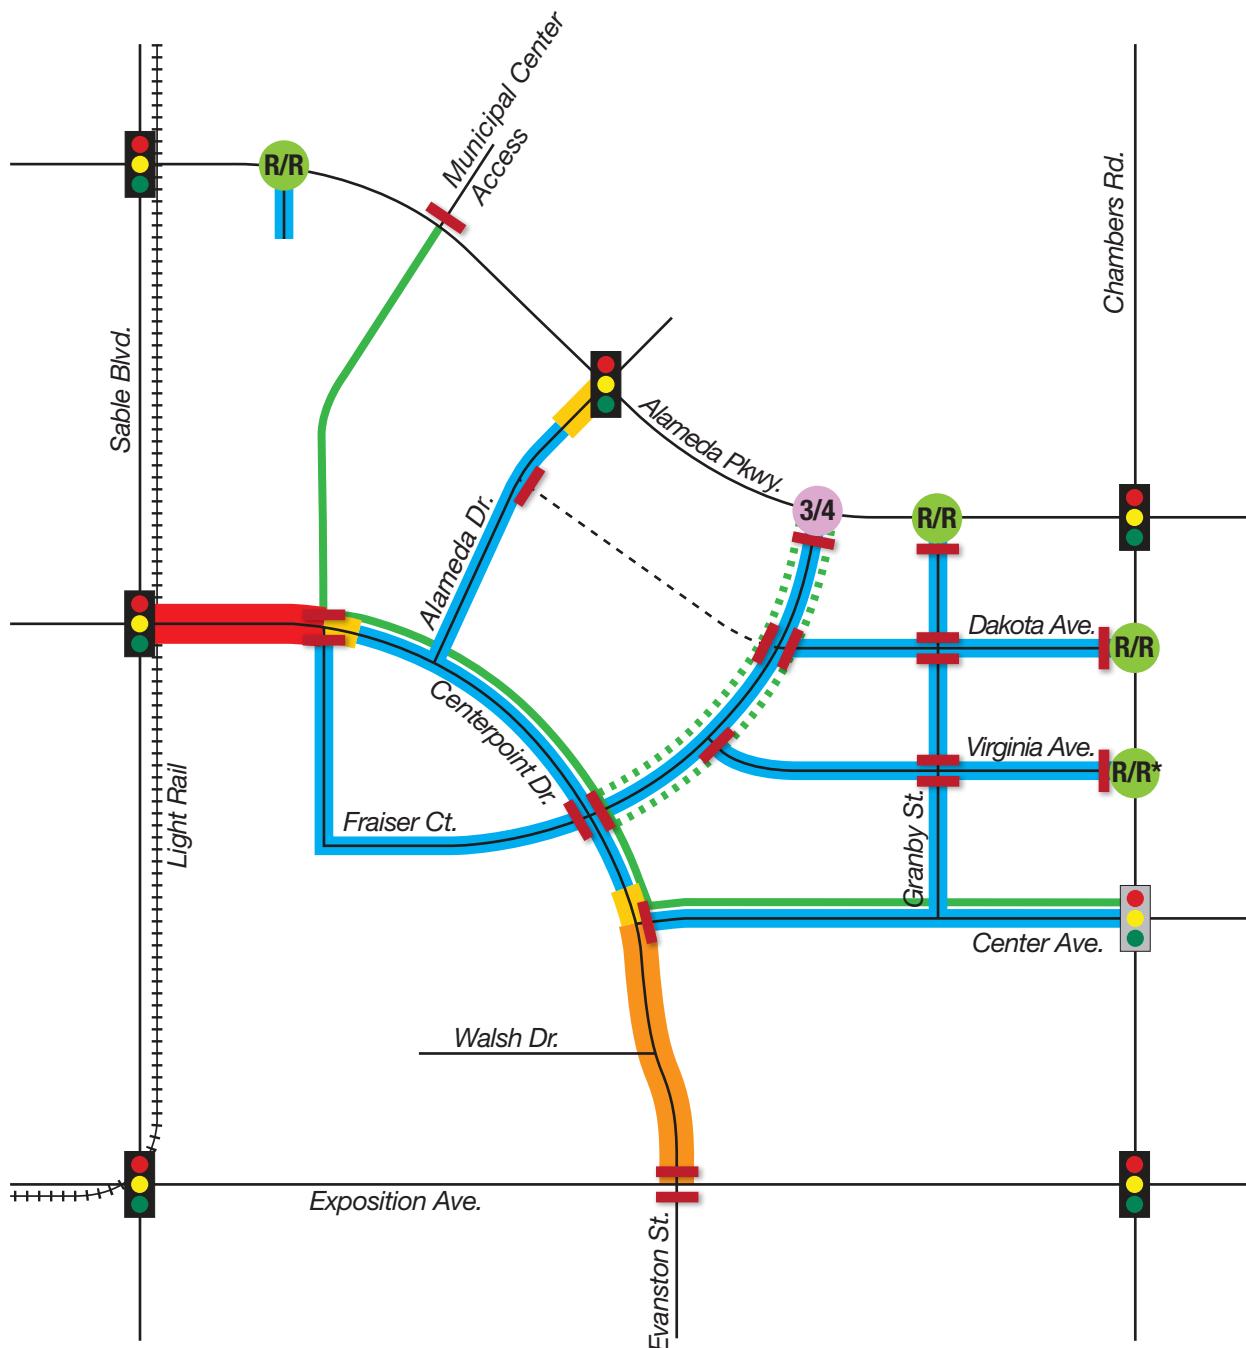

Centrepoint Drive would remain between Sable Boulevard and Exposition Avenue. However, the cross-section of Centrepoint Drive would be reduced from a three-lane collector roadway with a two-way left-turn lane to a two-lane local roadway between Dawson Street and Center Avenue.

Study Intersections

Several new public street intersections would be created as a part of the Metro Center development. The following new intersections were evaluated in this TIS:

13. Alameda Ave & Parcel A1
14. Alameda Pkwy & Fraser Ct
15. Alameda Pkwy & Granby St
17. Parcel A2/Arapahoe County & Alameda Dr
18. Dakota Ave/Arapahoe County & Fraser Ct
19. Dakota Ave & Granby St
20. Dakota Ave & Chambers Rd
21. Centrepoint Dr & Dawson St
22. Fraser Ct & Centrepoint Dr
23. Virginia Ave & Fraser Ct
24. Virginia Ave & Granby St
25. Virginia Ave & Chambers Rd
26. Center Ave & Granby St

Figure 5 displays proposed roadway and intersection characteristics for the proposed Metro Center development area. **Table 4** displays the characteristics of intersections added to the study area because of the proposed changes to the roadway network. Several two-way stop control intersections in the table currently exist but would be modified as part of the development to change intersection geometry or provide additional site access.

I8	Dakota Ave/Arapahoe Co & Fraser Ct	Full-Movement	Dakota Ave/Arapahoe Co
I9	Dakota Ave & Granby St	Full-Movement	Granby St
I20	Dakota Ave & Chambers Rd	Right-In/Right-Out	Dakota Ave
I21	Centrepoint Dr & Dawson St	Full-Movement	Dawson St
I22	Centrepoint Dr & Fraser Ct	Full-Movement	Fraser Ct
I23	Virginia Ave & Fraser Ct	Full-Movement	Virginia Ave
I24	Virginia Ave & Granby St	Full-Movement	Granby St
I25	Virginia Ave & Chambers Rd	Right-In/Right-Out & Southbound Left	Virginia Ave
I26	Center Ave & Granby St	Full-Movement	Granby St

III.C Proposed Bicycle and Pedestrian Infrastructure

In addition to improved roadway infrastructure, Metro Center would also provide a robust network for non-motorized transportation modes. The curvilinear grid network proposed on the site would provide viable options for users on all parts of the site to make trips via walking or bicycle. Metro Center would provide enhanced facilities for bicyclists and pedestrians at the following locations:

- ▶ Sidewalks on both sides of all internal streets
 - Connectivity provided to external sidewalks and multiuse paths
- ▶ Two-way, separated bicycle lanes along multiple internal streets
 - North/east side of Centrepoint Drive between Dawson Street and Center Avenue
 - North side of Center Avenue between Centrepoint Drive and Chambers Road
- ▶ One-way striped bicycle lanes on both sides of Fraser Court between Alameda Parkway and Centrepoint Drive
- ▶ Dedicated bicycle and pedestrian throughway along the Dawson Street alignment between Alameda Avenue and Centrepoint Drive
 - Allowances for emergency vehicle access

III.D Changes from the Metro Center Master TIS

Since the Metro Center Master TIS was prepared, several changes to land use and site access are proposed in the Master Plan Amendment development plan that would change the traffic impacts of the site.

Land Use

Proposed land use changes have been identified throughout the Metro Center site, which could alter the estimated traffic volumes generated by the proposed development compared to evaluations in the *Metro Center Master TIS*. **Table 5** summarizes these changes for each planning area.

As shown, the proposed hotel and commercial uses in Parcel A1 are replaced with affordable housing units. Parcel A2 and A3 are combined into a single Parcel A2, with higher multifamily residential density and less commercial/mixed-use space. The supermarket previously proposed in Parcel A2 moves to Parcel B2.

Within Parcel B, office uses would be reduced in size or replaced with commercial/mixed-use space. Multifamily residential density increases were compared to those in the *Metro Center Master TIS*. Senior adult housing replaces market-rate residential units in Parcel B5. Within Parcel C, the distribution of multifamily residential units changes, but overall density within the parcel remains the same.

Table 5. Proposed Land Use Updates

Parcel	Metro Center Master TIS		Master Plan Amendment	
	Land Use	Size	Land Use	Size
A1	Hotel	100 Rm	Affordable Housing	150 DU
	Commercial/Mixed-Use	5.5 KSF		
A2	Supermarket	24 KSF	Multifamily Residential (Mid-Rise) *	600 DU
	Commercial/Mixed-Use	22.5 KSF		
A3	Multifamily Residential (Mid-Rise)	300 DU	Commercial *	15 KSF
	Commercial/Mixed-Use	15 KSF		
B1	Office	40 KSF	Bank	6.5 KSF
			Medical-Dental Office	3.5 KSF
			High-Turnover Sit-Down Restaurant	5.5 KSF
B2	Office	60 KSF	Supermarket	22.88 KSF
B3	Multifamily Residential (Low Rise)	72 DU	Multifamily Residential (Mid-Rise)	99 DU
B4	Multifamily Residential (Low Rise)	63 DU	Multifamily Residential (Mid-Rise)	111 DU
B5	Multifamily Residential (Low Rise)	200 DU	Senior Adult Housing – Multifamily	220 DU
B6	Multifamily Residential (Low Rise)	100 DU	Multifamily Residential (Mid-Rise)	150 DU
C1	Multifamily Residential (Mid-Rise)	350 DU	Multifamily Residential (Mid-Rise)	385 DU
C2	Multifamily Residential (Mid-Rise)	225 DU	Multifamily Residential (Mid-Rise)	215 DU
C3	Multifamily Residential (Mid-Rise)	225 DU	Multifamily Residential (Mid-Rise)	200 DU

Notes: An asterisk (*) indicates that Parcel A2 and A3 are combined in the Master Plan Amendment as Parcel A2.

DU = dwelling units KSF = thousand square feet Rm = rooms

Site Access

Modifications to proposed development access since the *Metro Center Master TIS* include:

- ▶ **Virginia Avenue & Chambers Rd (#25)** was previously identified to provide three-quarter movement access, permitting northbound and southbound left- and right-turns but prohibiting eastbound and westbound left-turns.
 - Under the *Aurora Metro Center PA-B Infrastructure Site Plan Traffic Impact Study*⁴ (Parcel B TIS), access was modified to prohibit northbound left-turns.
- ▶ **Dawson Street** was previously identified to connect from Fraser Court to Alameda Avenue adjacent to the RTD Aurora Metro Center Station and aligned with the Municipal Center Access.
 - Under the Master Plan Amendment, the segment of Dawson Street from Centrepoint Drive to Alameda Avenue would no longer be constructed with vehicular access.
 - Instead, the Dawson Street alignment would serve as a bicycle and pedestrian throughway with allowances for emergency vehicle access.
- ▶ **Dakota Avenue** was previously identified to connect Dawson Street to Chambers Road and pass through the Arapahoe County property.
 - Under the Master Plan Amendment, the segment of Dakota Avenue from Dawson Street to Alameda Drive would not be constructed, and the segment from Alameda Drive to Fraser Court would not provide vehicular access for through traffic.
- ▶ **Parcel A1** was previously identified to have access via a RIRO vehicular access to Alameda Avenue and a full-movement access at the Dakota Avenue & Dawson Street intersection.
 - Under the Master Plan Amendment, access via the Dawson Street alignment would be restricted to emergency vehicles only, and the RIRO access to Alameda Parkway would be the only public vehicular access point.
- ▶ **Parcels A2 and A3** were previously identified to be located between Dawson Street and Alameda Drive and bifurcated by Dakota Avenue.
 - Under the Master Plan Amendment, these parcels would be combined into Parcel A2, and access would come from Alameda Drive.

III.E Site-Generated Trips

Similar to the *Metro Center Master TIS*, the trip generation potential of the Metro Center development proposed under the Master Plan Amendment was evaluated based on land use type and size. Data from *Trip Generation, 11th Edition* (Institute of Transportation Engineers, 2021) was referenced to determine vehicle-trips generated by the proposed development on typical weekdays and during morning and evening peak hours.

Table 6 presents the trip generation information for a typical weekday. As shown, Metro Center could be expected to generate nearly 14,100 total daily trips, including about 1,050 in the morning peak hour and about 1,300 in the evening peak hour.

The mix of land uses in the proposed development would lend itself to internal trip-making. Internal trips were calculated using information contained in *Trip Generation Handbook, 3rd Edition* (Institute of Transportation Engineers, 2017) and the NCHRP 684 Internal Trip Capture Estimation tool. Approximately 2,860 daily trips (20 percent of total) would be made internally, including about 65 during the morning peak hour (6 percent) and 160 during the evening peak hour (12 percent). Like the *Metro Center Master TIS*, 30 percent of internal trips were assumed to be made with vehicles, while 70 percent would be made with non-motorized modes.

⁴ *Aurora Metro Center PA-B Infrastructure Site Plan Traffic Impact Study*. Felsburg Holt & Ullevig, Greenwood Village, Colorado. September 2022. FHU Reference No. 119405-03.

Table 6. Trip Generation Summary

Parcel	Land Use	ITE Code	Size	Daily Trips	Morning Peak Hour			Evening Peak Hour		
					In	Out	Total	In	Out	Total

C3	Multifamily Residential (Mid-Rise)	221	200 DU	908	17	59	76	48	30	78
Total Trip Generation				14,056	330	711	1,041	749	565	1,314
Internal Trip Capture				2,860	32	32	64	79	79	158
Vehicular Internal Trips (30%)				858	10	10	20	24	24	48
Non-Motorized Internal Trips (70%)				2,002	22	22	44	55	55	110
Total External Trips				11,196	298	679	977	670	486	1,156
Transit Mode Share Adjustments				1,381	36	95	131	80	56	136
Pass-By Adjustments				330	0	0	0	51	51	102
Net External Vehicle Trip Generation				9,485	262	584	846	539	379	918
Net Internal Vehicle Trip Generation				858	10	10	20	24	24	48

Like the *Metro Center Master TIS*, reductions to external trip generation were made to account for transit use based on proximity to the RTD Aurora Metro Center Station. The following transit mode share percentages were reused from the *Metro Center Master TIS*:

- ▶ Residential: 15%
- ▶ Commercial: 5% (excludes supermarket trips)
- ▶ Office: 5%

These assumptions for transit mode share result in a reduction of 12 percent of daily **external** trips, 13 percent of morning peak hour **external** trips, and 12 percent of evening peak hour **external** trips.

Pass-by trip reductions were also considered using assumptions from the *Metro Center Master TIS* using methods from the *Trip Generation Handbook*, including 20 percent for general commercial trips and 40 percent for supermarket trips during the evening peak hour. Morning peak hour pass-by trip reductions were not

applied, and daily pass-by reductions were estimated as one-half of the evening peak hour rates. Overall, this results in a reduction of 3 percent of daily **external** trips and 9 percent of evening peak hour **external** trips.

Including all reductions, the proposed Metro Center development as defined in the Master Plan Amendment is expected to generate about 9,500 net **external** daily vehicle-trips, including nearly 850 in the morning peak hour and 920 in the evening peak hour. Additionally, the development would generate about 860 **internal** daily vehicle-trips, about 20 in the morning peak hour and 50 in the evening peak hour.

Compared to daily trip generation estimates from the *Metro Center Master TIS*, the current iteration of the proposed development would result in a decrease of 23 percent of **total** trips (all modes), including a decrease of 14 percent of **external** vehicle-trips and 49 percent of **internal** vehicle-trips.

III.F Trip Distribution and Traffic Assignment

The distribution of net external vehicle trips traveling to/from the proposed development assumed similar characteristics to what was used in the *Metro Center Master TIS*:

- ▶ Alameda Parkway west: 20%
- ▶ Sable Boulevard north: 15%
- ▶ Chambers Road north: 15%
- ▶ Alameda Parkway east: 20%
- ▶ Chambers Road south: 15%
- ▶ Sable Boulevard south: 10%
- ▶ Exposition Avenue west: 5%

This distribution is also depicted on **Figure 6**. Morning and evening peak hour vehicle-trips, including all internal and pass-by trips, were assigned to the proposed network using these distribution assumptions with some judgment to determine the shortest path. **Figure 6** also depicts peak hour site-generated traffic volumes for study area intersections. Of note, application of pass-by trips to the traffic assignment would result in a reduction of traffic volumes for the westbound through movement at the Alameda Avenue/Parkway & Alameda Drive intersection during the evening peak hour.

III.G Existing Plus Site Traffic Volumes

Site-generated traffic volumes shown on **Figure 6** were combined with existing traffic volumes shown on **Figure 3** to create an “Existing Plus Site” scenario. This scenario represents a near-term condition in which Metro Center is built out, but long-term regional background traffic growth has not yet occurred.

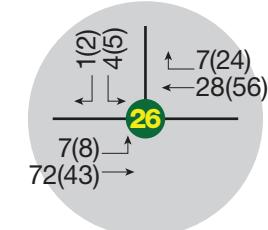

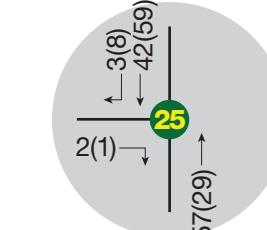

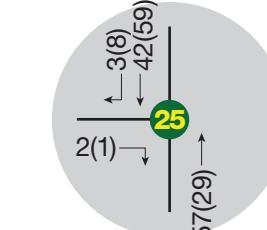

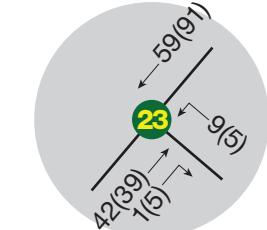

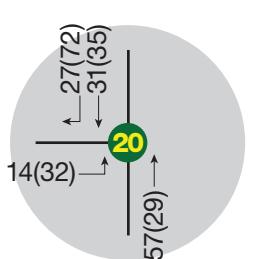

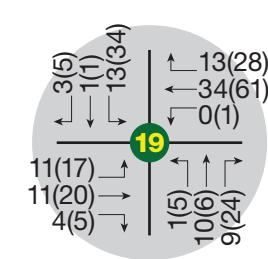

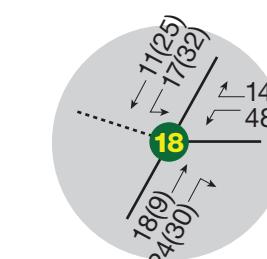

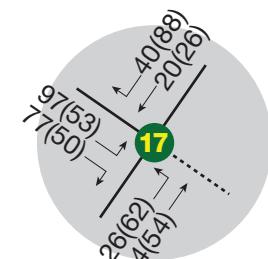

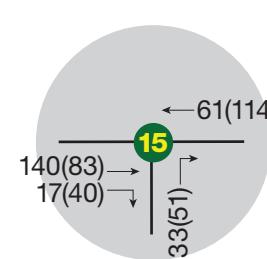

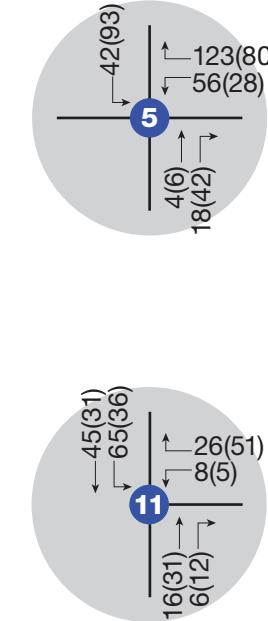

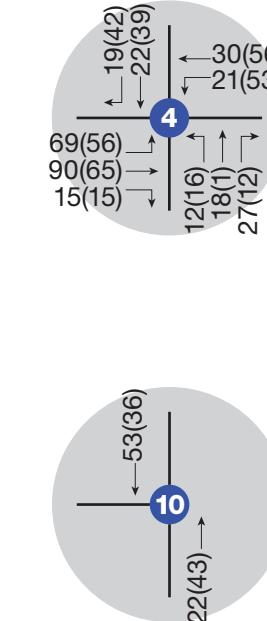

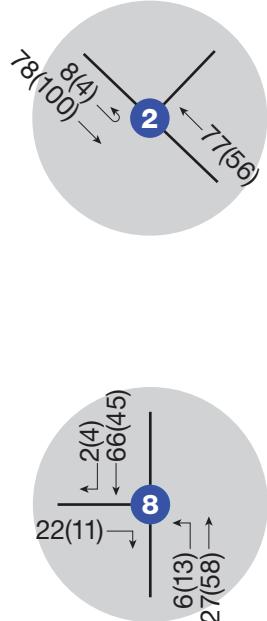

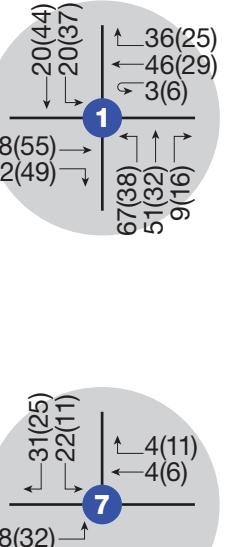

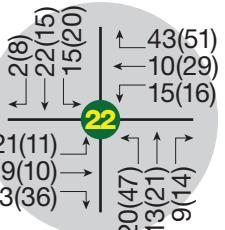

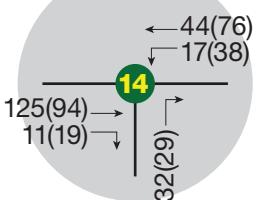

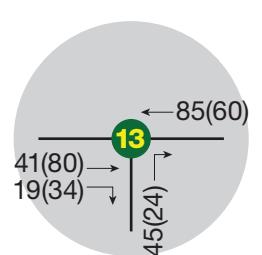

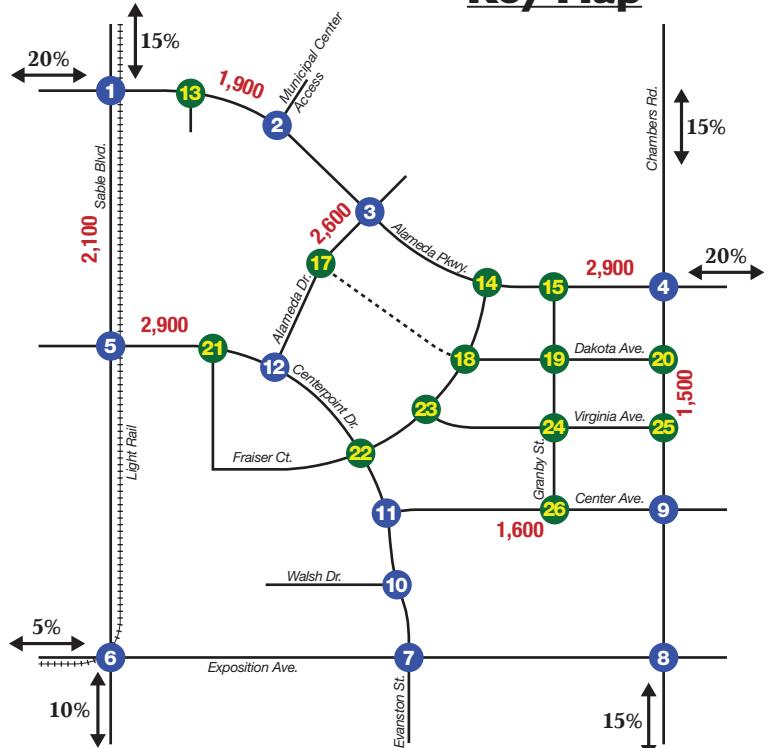

Figure 7 displays estimates of daily and peak hour traffic volumes within the study area for the Existing Plus Site scenario. As shown, Alameda Avenue/Parkway would serve between 45,700 and 49,900 VPD including the proposed development, with an average of 3,200 VPH during the morning peak hour and 3,475 VPH during the evening peak hour.

South of Alameda Avenue, Sable Boulevard would serve 15,400 VPD, including 950 VPH during the morning peak hour and 1,350 VPH during the evening peak hour. Alameda Drive would serve 5,300 VPD; 400 VPH during the morning peak hour and 450 VPH during the evening peak hour. Chambers Road would serve 38,600 VPD; 2,700 VPH during the morning peak hour and 3,350 VPH during the evening peak hour.

East of Sable Boulevard, Centrepoint Drive would serve 5,800 VPD, including 425 VPH during the morning peak hour and 500 VPH during the evening peak hour. West of Chambers Road, Center Avenue would serve 2,400 VPD, including 200 VPH during the morning peak hour and 200 VPH during the evening peak hour.

Section V presents results of the operational evaluation of this scenario.

Metro Center Amendment TIS | 24-134-01 | 05/17/24

IV. Future Conditions

This section evaluates anticipated traffic volume growth expected over a long-term planning horizon of 20 years (Year 2040). The 2040 planning horizon was selected for consistency with the *Metro Center Master TIS*.

IV.A Future (2040) Background Traffic Volumes

Background traffic represents the component of traffic growth independent of the proposed site that is expected to use the surrounding roadway network. Estimates of background traffic growth for roadways within the study area were calculated using assumptions from the *Metro Center Master TIS* of a uniform rate of 1.5 percent per year based on review of the Denver Regional Council of Governments (DRCOG) "Focus" and Northeast Aurora Transportation Study (NEATS) travel demand models.

Figure 8 displays estimates of daily and peak hour traffic volumes within the study area for the Future (2040) Background Traffic scenario. As shown on **Figure 8**, Alameda Avenue/Parkway would serve between 55,700 and 55,500 VPD along the frontage of the proposed development, with an average of 3,850 VPH during the morning peak hour and 4,175 VPH during the evening peak hour by Year 2040.

South of Alameda Avenue, Sable Boulevard would serve 17,000 VPD, including 1,000 VPH during the morning peak hour and 1,475 VPH during the evening peak hour. Alameda Drive would serve 3,600 VPD, including 225 VPH during the morning peak hour and 300 VPH during the evening peak hour. Chambers Road would serve 50,700 VPD, including 3,275 VPH during the morning peak hour and 4,100 VPH during the evening peak hour.

East of Sable Boulevard, Centrepoint Drive would serve 3,800 VPD, including 225 VPH during the morning peak hour and 325 VPH during the evening peak hour. West of Chambers Road, Center Avenue would serve 1,200 VPD, including 100 VPH during the morning peak hour and 75 VPH during the evening peak hour.

Section V presents results of the operational evaluation of this scenario.

IV.B Future (2040) Total Traffic Volumes

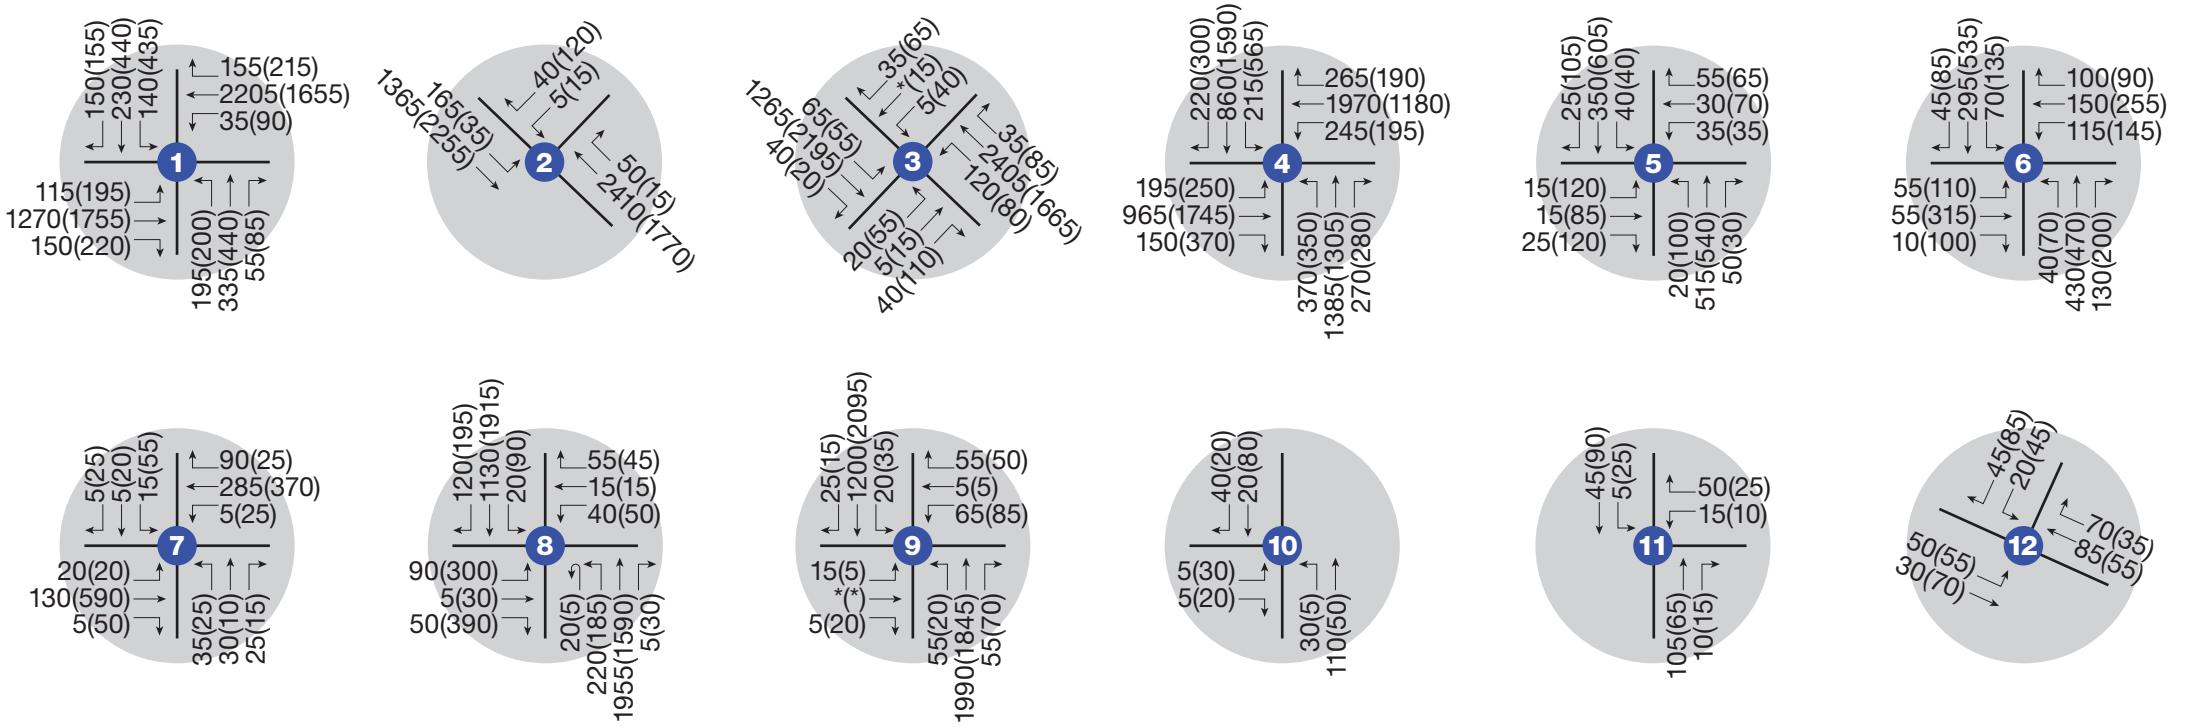

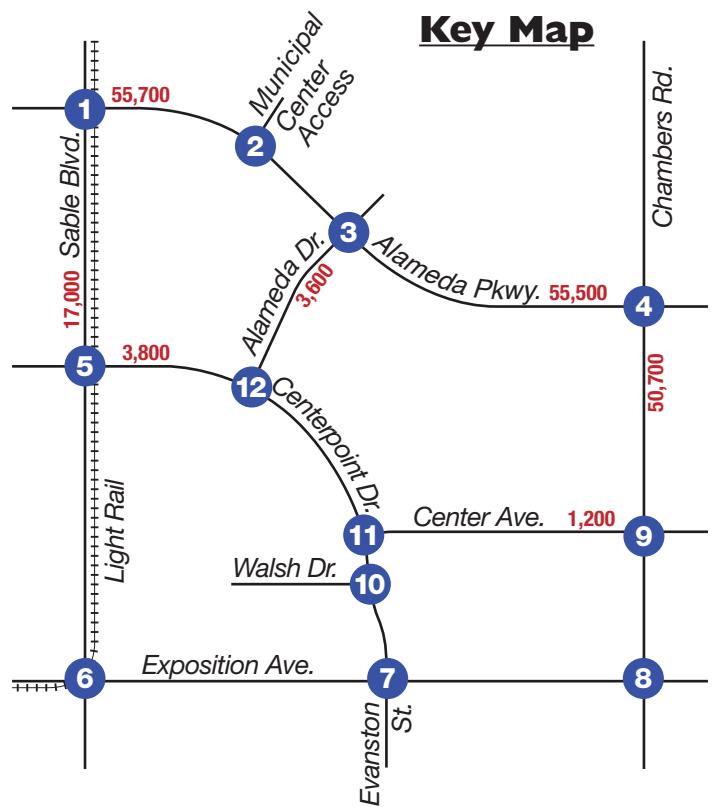

Total traffic represents the future scenario in which vehicle-trips generated by the proposed Metro Center development (shown on **Figure 6**) are added to the Future (2040) Background Traffic volumes (shown on **Figure 8**). Total traffic volumes also account for all internal and pass-by trip-making. **Figure 9** displays estimates of daily and peak hour traffic volumes within the study area for the Future (2040) Total Traffic scenario.

As shown on **Figure 9**, Alameda Avenue/Parkway would serve between 57,600 and 58,400 VPD, including the proposed development, with an average of 4,050 VPH during the morning peak hour and 4,350 VPH during the evening peak hour by Year 2040.

South of Alameda Avenue, Sable Boulevard would serve 19,100 VPD, including 1,175 VPH during the morning peak hour and 1,650 VPH during the evening peak hour. Alameda Drive would serve 6,200 VPD, including 450 VPH during the morning peak hour and 525 VPH during the evening peak hour. Chambers Road would serve 52,200 VPD, including 3,400 VPH during the morning peak hour and 4,225 VPH during the evening peak hour.

East of Sable Boulevard, Centrepoint Drive would serve 6,700 VPD, including 475 VPH during the morning peak hour and 575 VPH during the evening peak hour. West of Chambers Road, Center Avenue would serve 2,800 VPD, including 250 VPH during the morning peak hour and 200 VPH during the evening peak hour.

Section V presents results of the operation evaluation of this scenario.

Future (2040) Total
Traffic Volumes

V. Evaluation and Mitigations

Due to site-generated traffic from the proposed Metro Center development, daily traffic volumes on the surrounding arterial network (Alameda Avenue/Parkway, Sable Boulevard, Chambers Road, and Exposition Avenue) would increase by 5.2 percent to 8.1 percent. The increases in traffic volumes resulting from background traffic growth and site-generated trips would impact traffic conditions on roadway segments and at intersections within the study area. This section evaluates impacts to LOS, vehicle queueing, and safety and provides recommendations for mitigations to meet the TIS guidelines provided by Aurora.

V.A Level of Service

Changes in traffic volumes at intersections also change LOS due to increased delays. Aurora's Traffic Impact Study Guidelines stipulate that peak hour intersection operations should be at LOS D or better. Mitigation measures should be considered for intersections that would not meet these standards, with some exceptions.

Methodology Changes

Similar to the *Metro Center Master TIS*, modifications to PHFs were assumed for LOS analyses in Existing Plus Site and all Future (2040) scenarios. The worst expected PHF 0.75 was averaged with the HCM default of 0.92 to achieve a PHF of 0.84 for all new intersection approaches.

When evaluating LOS for the Future (2040) scenarios, traffic signal timings for non-light rail intersections were assumed to be modified to better serve forecasted traffic volumes, including increased cycle lengths, adjusted phase splits, and modifying sequencing.

Summary of Level of Service Evaluation

LOS was calculated for each signalized intersection and unsignalized intersection movement in the study area for all scenarios. **Table 7** summarizes LOS at all signalized intersections, and **Table 8** summarizes LOS for all unsignalized intersection movements.

Table 7. Signalized Intersection Level of Service Summary

#	Intersection	Morning / Evening Peak Hour Level of Service			
		Existing (2024)	Existing Plus Site	Future (2040) Background	Future (2040) Total
1	Alameda Ave & Sable Blvd *	C / D	C / D	D / E	D / F
3	Alameda Ave/Pkwy & Alameda Dr	A / A	A / B	A / A	A / B
4	Alameda Pkwy & Chambers Rd	D^ / D	E / E	F / E	F / F
5	Centrepoint Dr & Sable Blvd *	B / C	C / C^	C / C^	C / C^
6	Exposition Ave & Sable Blvd *	C / D	C / D^	C / D^	C / E
8	Exposition Ave & Chambers Rd	A / C^	A / C^	B / D^	B / D^

Notes: An asterisk (*) indicates that Synchro-based LOS is reported for the intersection.

A **yellow highlight** indicates the LOS does not meet Aurora standards.

A caret (^) indicates individual movements at LOS F despite overall intersection operations of LOS D or better.

Table 8. Unsignalized Intersection Level of Service Summary

Section II.E presents additional details on LOS for Existing Conditions. The following sections discuss LOS and potential mitigations for each scenario. **Appendix B** includes worksheets for LOS evaluations.

Existing Plus Site

Figure 10 displays LOS and lane configurations for intersections included in the Existing Plus Site evaluation. As shown in **Table 7**, in **Table 8**, and on **Figure 10**, signalized intersection LOS would not meet Aurora standards at Alameda Parkway & Chambers Road (#4), Centrepoint Drive & Sable Boulevard (#5), Exposition Avenue & Sable Boulevard (#6), and Exposition Avenue & Chambers Road (#8). Additionally, southbound left-turns at Alameda Avenue & Municipal Center Access (#2) would operate at LOS F during both peak hours.

Mitigations recommended to address operations for Existing Conditions shown in **Section II.E** would also be suitable to address the Existing Plus Site scenario. New mitigations should be considered at Centrepoint Drive & Sable Boulevard (#5) and Center Avenue & Chambers Road (#9).

2. Alameda Avenue & Municipal Center Access

No improvements are recommended for the southbound left-turn movement at Alameda Avenue & Municipal Center Access (#2). This movement serves light traffic demand (less than 10 VPH during peak hours) and alternate routes are available via Alameda Drive.

3. Alameda Avenue/Parkway & Alameda Drive

Like the Existing Conditions scenario, traffic signal cycle lengths for the Alameda Avenue/Parkway & Alameda Drive (#3) intersection should be increased during the evening peak hour to match the 135-second cycle used at the Alameda Parkway & Chambers Road (#4) intersection. Additionally, westbound left-turn operations should be modified to provide protected/permitted phasing to serve additional traffic volume generated by Metro Center. The Alameda Avenue/Parkway & Alameda Drive (#3) intersection would continue to operate at LOS A/B during morning/evening peak hours, respectively.

4. Alameda Parkway & Chambers Road

A dedicated westbound right-turn lane should be constructed to serve the high-volume right-turn movement and to provide an overlap phase concurrent with southbound left-turns. Right-of-way constraints may limit the feasibility of this improvement. With a new westbound right-turn lane and overlap phase, the intersection would operate at LOS D during peak hours, but no movements would fall below LOS E.

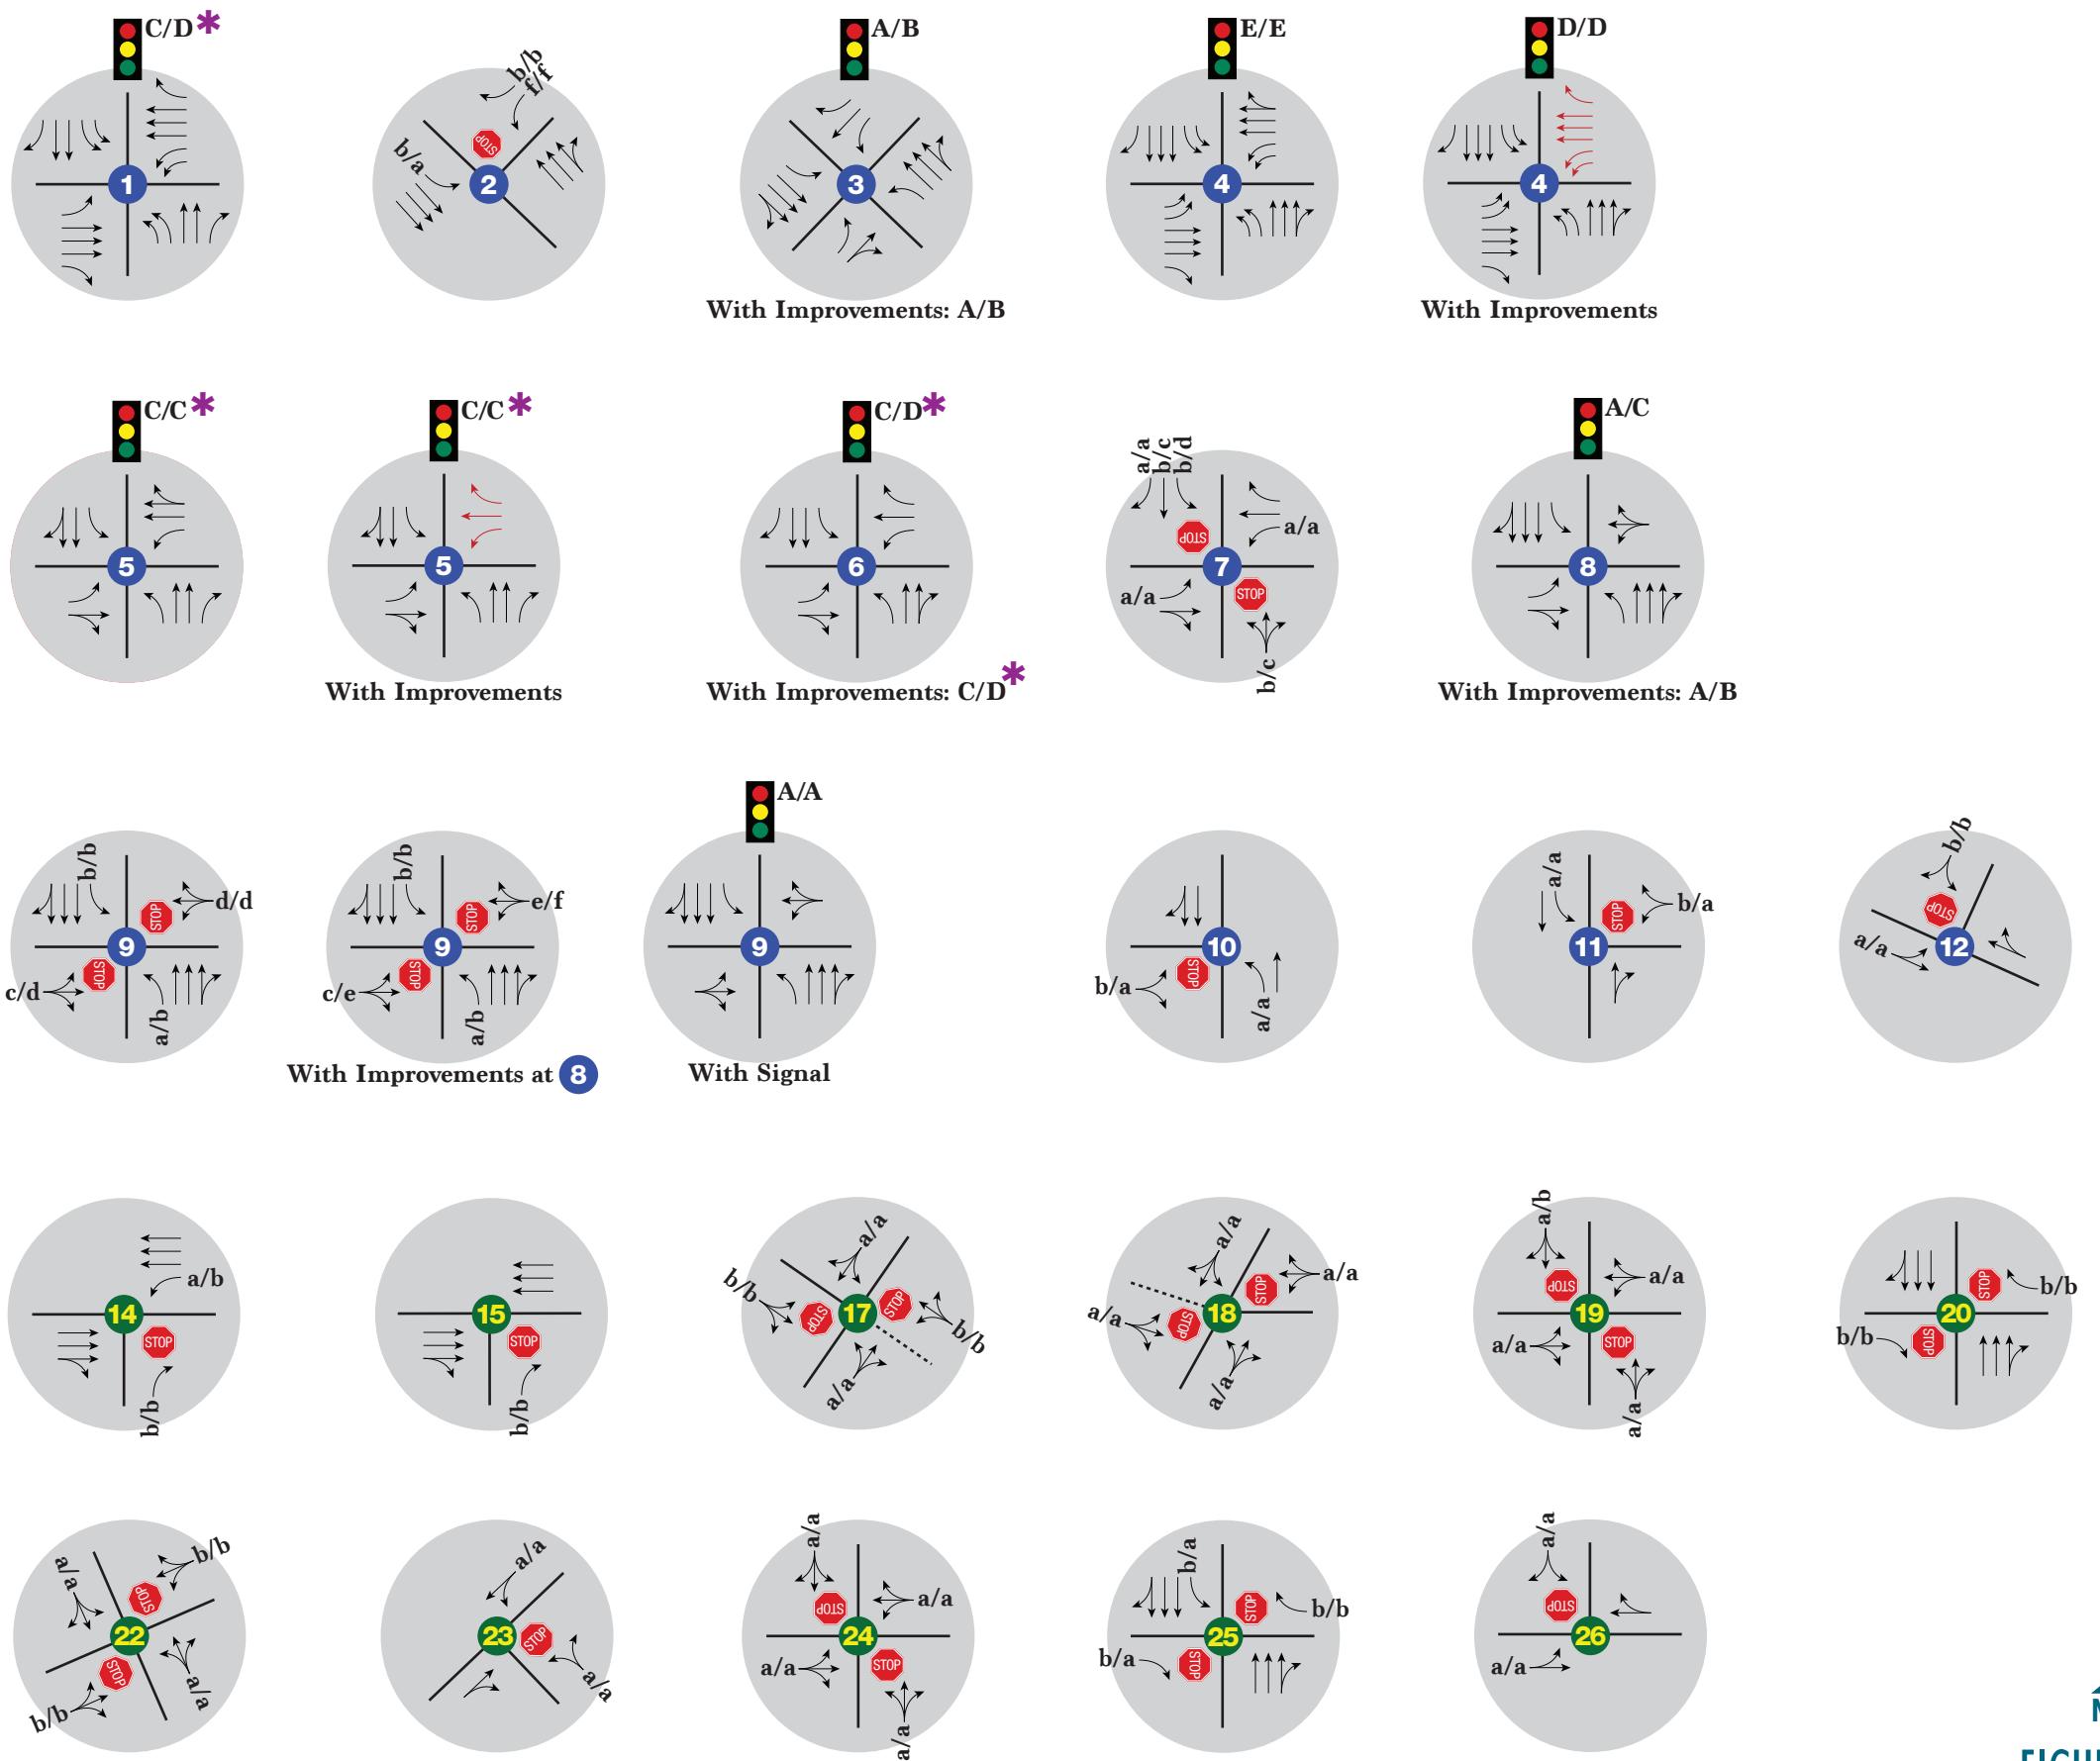

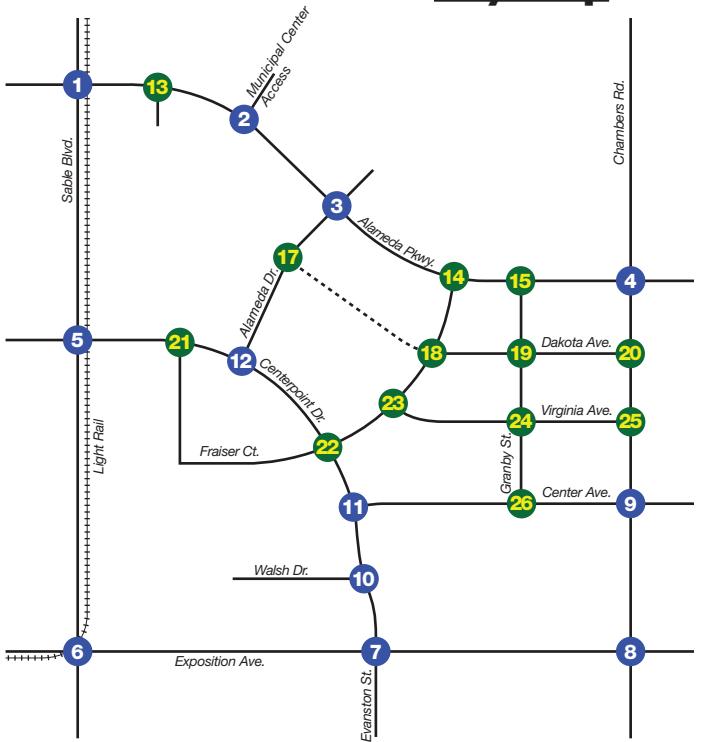

5. Centrepoint Drive & Sable Boulevard

To better serve westbound traffic generated by Metro Center, the shared through/right-turn lane should be restriped as a dedicated westbound right-turn lane. With this improvement, the intersection would continue to operate at LOS C during peak hours, but no movements would fall below LOS E. This improvement may require coordination and approval with the Colorado PUC.

6. Exposition Avenue & Sable Boulevard

A dedicated left-turn phase should be added for westbound Exposition Avenue, and westbound left-turns should operate with protected/permitted phasing. With this improvement, the intersection would continue to operate at LOS C/D during morning/evening peak hours, respectively. Aurora has already implemented this improvement.

* HCM LOS results not available.
Synchro LOS reported

FIGURE 10

Existing Plus Site
Traffic Operations

8. Exposition Avenue & Chambers Road

To improve the effectiveness of the eastbound right-turn overlap phase, signs explicitly prohibiting northbound U-turns should be implemented. With this improvement, the intersection could operate at LOS A/B during morning/evening peak hours, respectively. Westbound LOS would not improve, but viable alternatives are available approximately 300 feet south of Exposition Avenue and at Ohio Avenue/Ada Place.

9. Center Avenue & Chambers Road

With the introduction of displaced U-turn traffic from Exposition Avenue & Chambers Road (#8), eastbound and westbound operations at Center Avenue & Chambers Road (#9) would fall below LOS D during one or more peak hours. A new traffic signal should be installed at the intersection to service eastbound and westbound movements. This traffic signal was previously identified as an improvement in the *Metro Center TIS*. With a new traffic signal, including protected/permitted phases for northbound and southbound left-turns, the Center Avenue & Chambers Road (#9) intersection would operate at LOS A during both peak hours.

A signal warrant analysis evaluated existing and forecasted traffic volumes with respect to criteria from the MUTCD. A traffic signal is warranted based on 2024 traffic counts of the intersection and would continue to meet volume warrants in the Existing Plus Site scenario. **Appendix E** presents additional details on the warrant analysis.

Future (2040) Background Traffic

Figure 11 displays LOS and lane configurations for intersections included in the Future (2040) Background Traffic evaluation. As shown in **Table 7**, in **Table 8**, and on **Figure 11**, signalized intersection LOS would not meet Aurora standards at several locations:

- ▶ Alameda Avenue & Sable Boulevard (#1)
- ▶ Alameda Parkway & Chambers Road (#4)
- ▶ Centrepoint Drive & Sable Boulevard (#5)
- ▶ Exposition Avenue & Sable Boulevard (#6)
- ▶ Exposition Avenue & Chambers Road (#8)

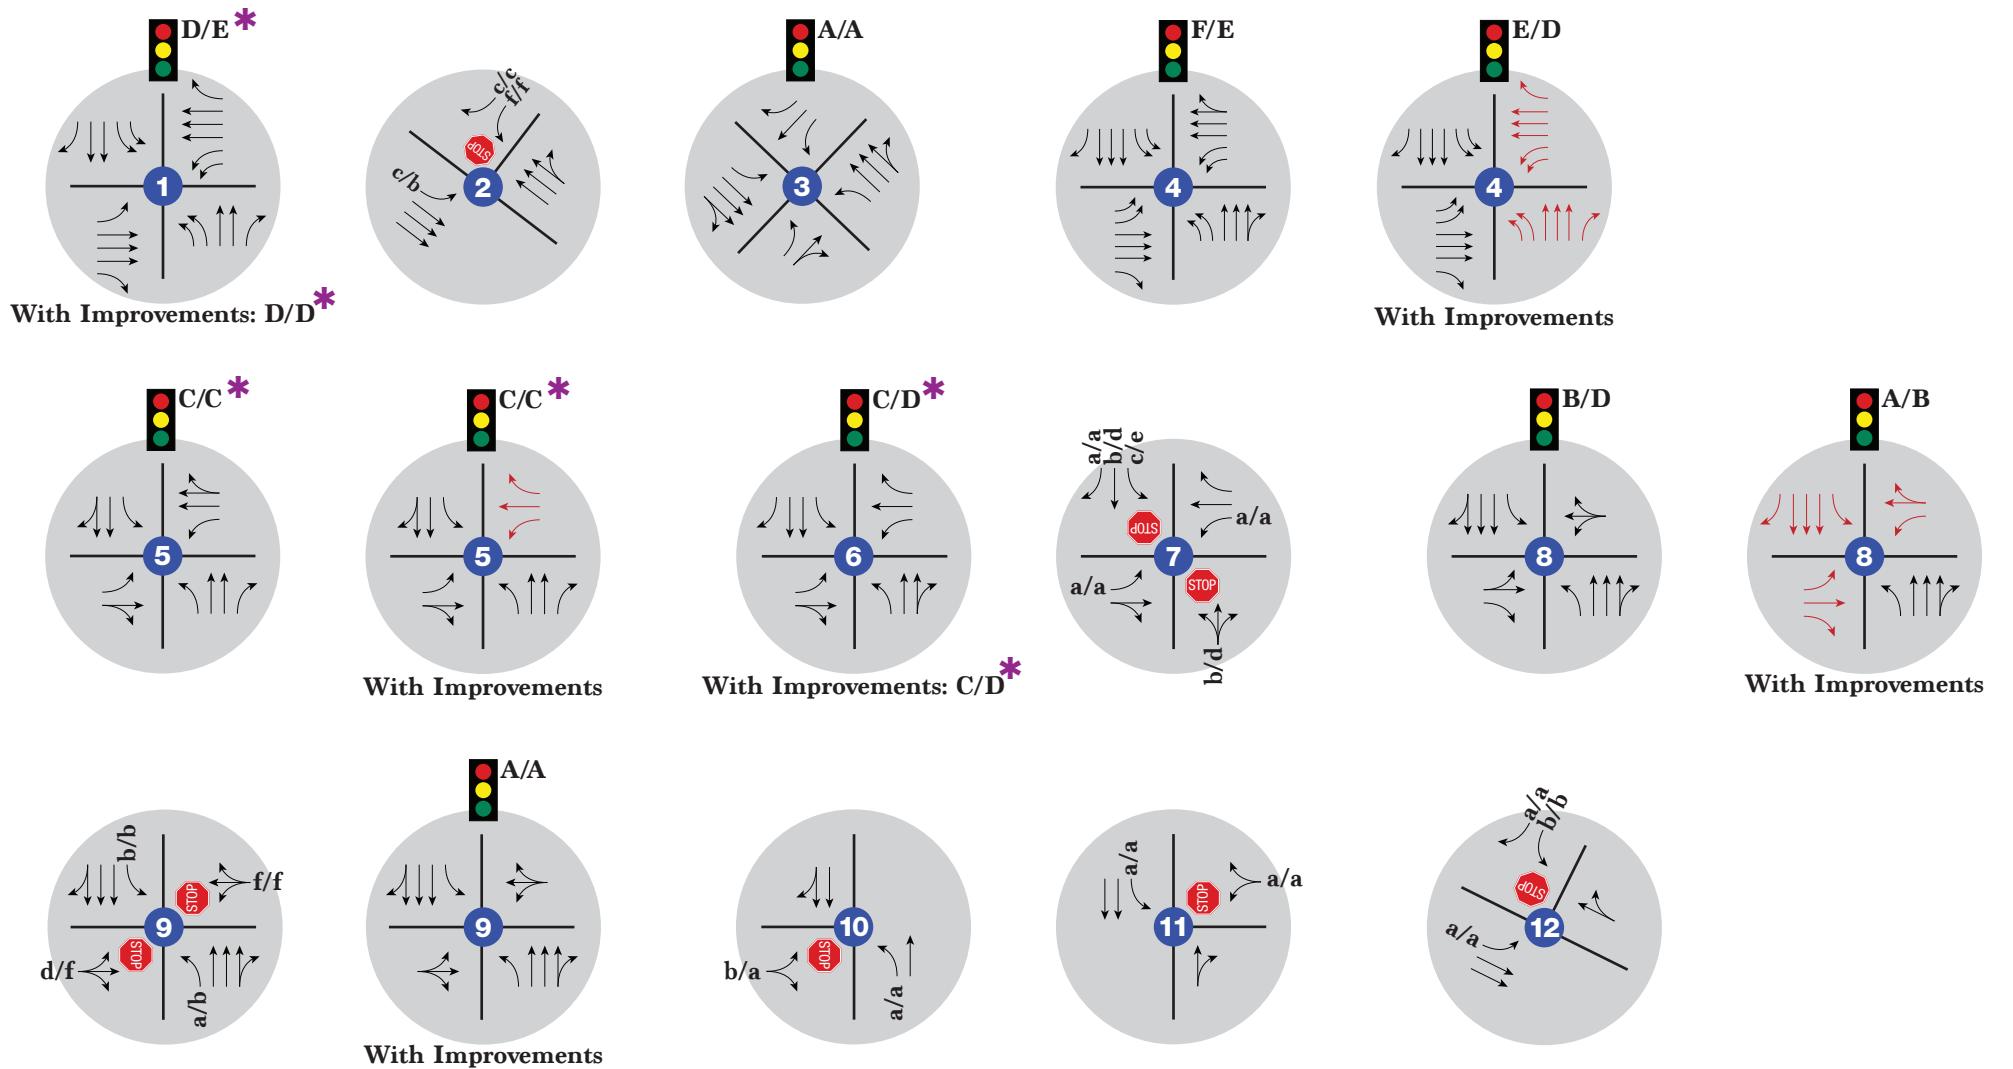

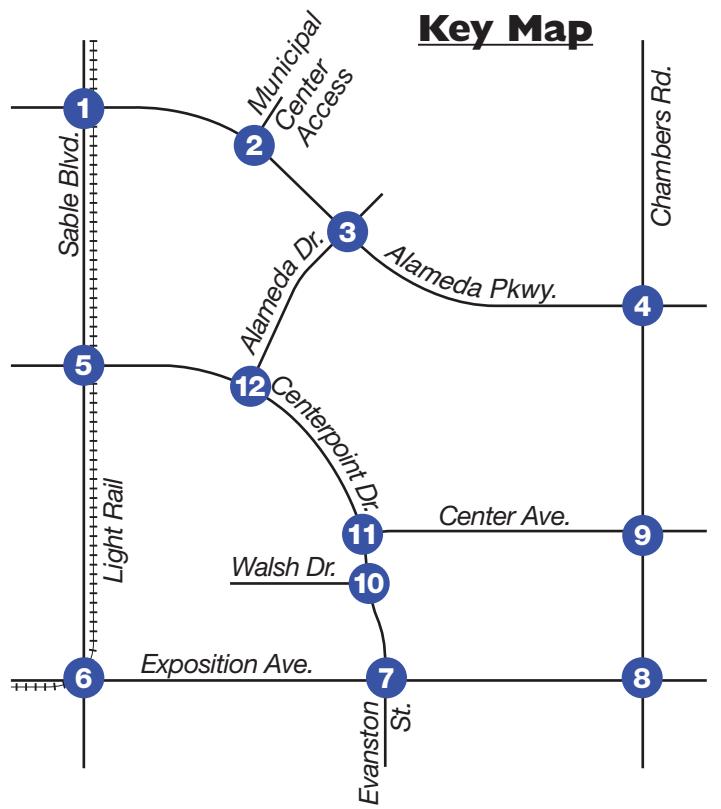

Additionally, several unsignalized movements would operate below LOS D during one or more peak hours:

- ▶ Alameda Avenue & Municipal Center Access (#2) – southbound left-turns
- ▶ Exposition Avenue & Centrepoint Drive (#7) – southbound left-turns
- ▶ Center Avenue & Chambers Road (#9) – all eastbound and westbound movements

While some improvements proposed to mitigate traffic operations in the Existing Plus Site scenario would also be suitable to address substandard LOS for the Future (2040) Background Traffic scenario, additional improvements should also be considered.

I. Alameda Avenue & Sable Boulevard

Eastbound and westbound through movements on Alameda Avenue should be given additional green time to serve forecasted volume growth in the Future (2040) Background Traffic scenario. With periodic signal timing improvements, the intersection could operate at LOS D during both peak hours with no movements falling below LOS E. Signal timing adjustments may require coordination and approval with the Colorado PUC.

LEGEND

X/X = AM/PM Peak Hour Signalized Intersection Level of Service

x/x = AM/PM Peak Hour Unsigned Intersection Level of Service

= Stop Sign

= Traffic Signal

* HCM LOS results not available.
Synchro LOS reported

NOTE: Drawing Not to Scale

2. Alameda Avenue & Municipal Center Access

No improvements are recommended for the southbound left-turn movement at Alameda Avenue & Municipal Center Access (#2). This movement serves light traffic demand (less than 10 VPH during peak hours) and alternate routes are available via Alameda Drive.

4. Alameda Parkway & Chambers Road

In addition to the westbound right-turn lane and overlap phase proposed to address Existing and Existing Plus Site conditions, a northbound right-turn lane should be constructed and provided with an overlap phase. Right-of-way constraints may limit the feasibility of this improvement. With new right-turn lanes and overlap phases, the intersection would improve to LOS E/D operations during morning/evening peak hours, respectively.

The Metro Center Master TIS also identified operational issues with the Alameda Parkway & Chambers Road (#4) intersection in the Future (2040) scenarios. As this intersection is a junction of two arterials, conflicting movements often compete for green time within the traffic signal cycle, making it difficult to improve operations without increasing capacity through capital projects, such as widening to eight through-lanes or constructing new turn-lanes. Innovative intersection alternatives could also be considered, such as displaced left-turns (continuous flow intersection), median U-turns, or a quadrant intersection. However, these alternatives often require extensive right-of-way that is not available at this location.

5. Centrepoint Drive & Sable Boulevard

Like the Existing Plus Site scenario, the shared through/right-turn lane should be restriped as a dedicated westbound right-turn lane. With this improvement, the Centrepoint Drive & Sable Boulevard (#5) intersection would continue to operate at LOS C during peak hours, but no movements would fall below LOS E. This improvement may require coordination and approval with the Colorado PUC.

6. Exposition Avenue & Sable Boulevard

Like the Existing Plus Site scenario, a dedicated left-turn phase should be added for westbound Exposition Avenue, and westbound left-turns should operate with protected/permitted phasing. With this improvement, the intersection would continue to operate at LOS C/D during morning/evening peak hours, respectively. Aurora has already implemented this improvement.

7. Exposition Avenue & Centrepoint Drive/Evanston Street

Although southbound left-turns at the Exposition Avenue & Centrepoint Drive/Evanston Street (#7) intersection operate at LOS E during the evening peak hour, no mitigation is recommended. This movement serves light traffic demand (less than 60 VPH during peak hours) and does not impede other traffic on Centrepoint Drive as there is a dedicated lane and alternate routes available via Center Avenue.

8. Exposition Avenue & Chambers Road

In addition to implementing signs explicitly prohibiting northbound U-turns, dedicated eastbound and westbound left-turn lanes should be constructed to provide additional capacity for those movements. These left-turn movements should operate with protected/permitted phasing. Finally, a dedicated southbound right-turn lane should be constructed to service the high-volume movement. With these improvements, the intersection could operate at LOS A/B during morning/evening peak hours, respectively, and no movements would fall below LOS E conditions.

9. Center Avenue & Chambers Road

Like the Existing Plus Site scenario, a traffic signal should be constructed for the Center Avenue & Chambers Road (#9) intersection with protected/permitted phasing for northbound and southbound left-turns. With this improvement, the intersection would operate at LOS A during both peak hours. Forecasted volumes would continue to meet MUTCD signal warrants in the Future (2040) Background Traffic scenario. **Appendix E** presents additional details on the warrant analysis.

Future (2040) Total Traffic

Figure 12 displays LOS and lane configurations for intersections included in the Future (2040) Total Traffic evaluation. As shown in **Table 7**, in **Table 8**, and on **Figure 12**, signalized intersection LOS would not meet Aurora standards at several locations:

- ▶ Alameda Avenue & Sable Boulevard (#1)
- ▶ Alameda Avenue/Parkway & Alameda Drive (#3)
- ▶ Alameda Parkway & Chambers Road (#4)
- ▶ Centrepoint Drive & Sable Boulevard (#5)
- ▶ Exposition Avenue & Sable Boulevard (#6)
- ▶ Exposition Avenue & Chambers Road (#8)

Additionally, several unsignalized movements would operate below LOS D during one or more peak hours:

- ▶ Alameda Avenue & Municipal Center Access (#2) – southbound left-turns
- ▶ Exposition Avenue & Centrepoint Drive (#7) – all northbound movements, southbound left-turns
- ▶ Center Avenue & Chambers Road (#9) – all eastbound and westbound movements

While some improvements proposed to mitigate traffic operations in the Existing Plus Site and Future (2040) Background Traffic scenarios would also be suitable to address substandard LOS for the Future (2040) Total Traffic scenario, additional improvements should also be considered.

1. Alameda Avenue & Sable Boulevard

Eastbound and westbound through movements on Alameda Avenue should be given additional green time to serve forecasted volume growth in the Future (2040) Total Traffic scenario. With periodic signal timing improvements, the intersection could operate at LOS D during both peak hours with no movements falling below LOS E. Signal timing adjustments may require coordination and approval with the Colorado PUC.

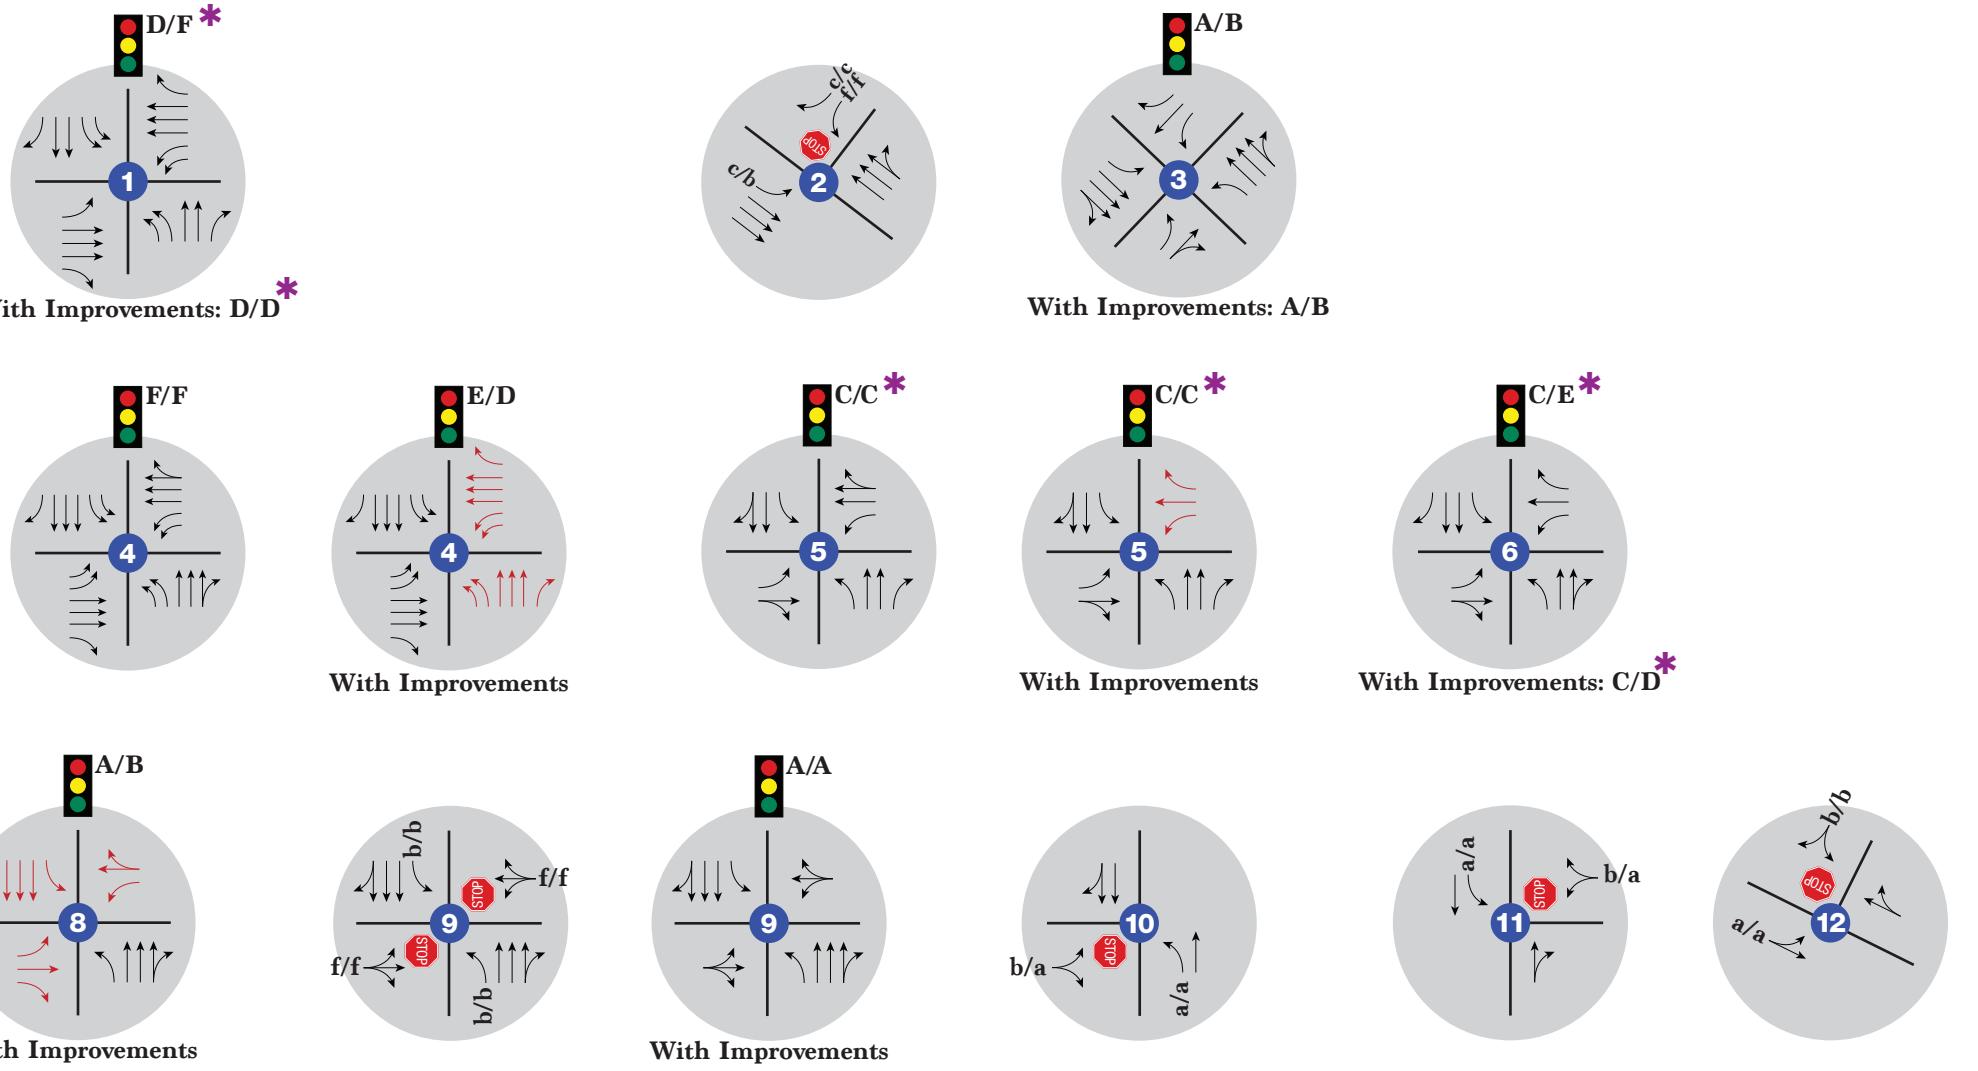

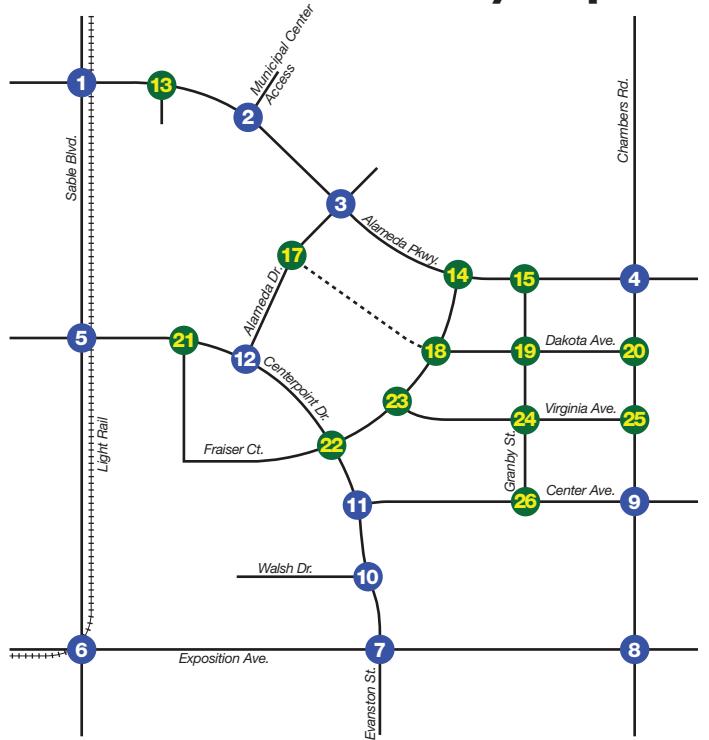

2. Alameda Avenue & Municipal Center Access

No improvements are recommended for the southbound left-turn movement at Alameda Avenue & Municipal Center Access (#2). This movement serves light traffic demand (less than 10 VPH during peak hours) and alternate routes are available via Alameda Drive.

3. Alameda Avenue/Parkway & Alameda Drive

Like the Existing Plus Site scenario, westbound left-turn operations should be modified to provide protected/permitted phasing to serve additional traffic volume generated by Metro Center. The Alameda Avenue/Parkway & Alameda Drive (#3) intersection would continue to operate at LOS A/B during morning and evening peak hours.

Key Map

* HCM LOS results not available.
Synchro LOS reported

NOTE: Drawing Not to Scale

4. Alameda Parkway & Chambers Road

Like the Future (2040) Background Traffic scenario, northbound and westbound right-turn lanes and overlap phases should be added to the intersection to separate through and right-turning traffic. Right-of-way constraints may limit the feasibility of this improvement. With new right-turn lanes and overlap phases, the intersection would improve to LOS E/D operations during morning/evening peak hours, respectively. Metro Center is not expected to contribute significant right-turn volume to either of these movements.

The *Metro Center Master TIS* also identified operational issues with the Alameda Parkway & Chambers Road (#4) intersection in the Future (2040) scenarios. As this intersection is a junction of two arterials, conflicting movements often compete for green time within the traffic signal cycle, making it difficult to improve operations without increasing capacity through capital projects, such as widening to eight through-lanes or constructing new turn-lanes. Innovative intersection alternatives could also be considered, such as displaced left-turns (continuous flow intersection), median U-turns, or a quadrant intersection. However, these alternatives often require extensive right-of-way that is not available at this location.

5. Centrepoint Drive & Sable Boulevard

Like the Existing Plus Site scenario, the shared through/right-turn lane should be restriped as a dedicated westbound right-turn lane. With this improvement, the Centrepoint Drive & Sable Boulevard (#5) intersection would continue to operate at LOS C during peak hours, but no movements would fall below LOS E. This improvement may require coordination and approval with the Colorado PUC.

6. Exposition Avenue & Sable Boulevard

Like the Existing Plus Site scenario, a dedicated left-turn phase should be added for westbound Exposition Avenue, and westbound left-turns should operate with protected/permitted phasing. With this improvement, the intersection would continue to operate at LOS C/D during morning/evening peak hours, respectively. Aurora has already implemented this improvement.

7. Exposition Avenue & Centrepoint Drive/Evanston Street

No improvements are recommended for the southbound left-turn movement at Exposition Avenue & Centrepoint Drive/Evanston Street (#7). This movement serves light traffic demand (less than 70 VPH during peak hours) and does not impede other traffic on Centrepoint Drive as there is a dedicated lane and alternate routes available via Center Avenue.

Mitigations were also not been identified for northbound Evanston Street, despite operating at LOS E during the evening peak hour. This approach serves a low volume of residential traffic (less than 50 VPH), and alternate routes are available from Walsh Drive (to Exposition Avenue) and from Ohio Avenue and Fraser Way (to Chambers Road).

8. Exposition Avenue & Chambers Road

Like the Future (2040) Background Traffic scenario, signs explicitly prohibiting northbound U-turns, dedicated eastbound and westbound left-turn lanes and protected/permitted phasing, and a dedicated southbound right-turn lane should all be provided. With these improvements, the intersection could operate at LOS A/B during morning/evening peak hours, respectively, and no movements would fall below LOS E conditions.

9. Center Avenue & Chambers Road

Like the Existing Plus Site and Future (2040) Background Traffic scenarios, a traffic signal should be constructed for the Center Avenue & Chambers Road (#9) intersection with protected/permitted phasing for northbound and southbound left-turns. With this improvement, the intersection would operate at LOS A

during both peak hours. Forecasted volumes would continue to meet MUTCD signal warrants in the Future (2040) Total Traffic scenario. **Appendix E** presents additional details on the warrant analysis.

V.B Roundabout Analysis

The original *Metro Center Master TIS* evaluated a single-lane roundabout alternative for the Exposition Avenue & Centrepoint Drive/Evanston Street (#7) intersection based on criteria from Aurora's TIS guidelines. In that study, a roundabout was found to provide reasonable peak hour traffic operations but was not identified as a recommended mitigation. No new roundabout analysis has been conducted for this study. Aurora may consider further evaluation of a roundabout at the Exposition Avenue & Centrepoint Drive/ Evanston Street (#7) intersection to determine feasibility with respect to geometry, right-of-way, sight distance, bicycle accommodations, etc.

V.C Queueing

Like the *Metro Center Master TIS*, a queueing analysis was conducted at all study area intersections to determine desirable storage lengths for turn lanes and feasibility of proposed intersection spacing. The 95th percentile queue length from traffic movements in the Future (2040) Total Traffic scenario (with recommended mitigations included) was used to provide recommendations of turn lane lengths. The following improvements were included in the analysis:

- ▶ Revised signal timing at Alameda Avenue & Sable Boulevard (#1)
- ▶ Implementation of protected/permitted left-turn phasing for the westbound approach of Alameda Avenue/Parkway & Alameda Drive (#3)
- ▶ Construction of northbound and westbound right-turn lanes at the Alameda Parkway & Chambers Road (#4) intersection
 - Overlap phasing for right-turns on all four approaches
- ▶ Restriped westbound approach at Centrepoint Drive & Sable Boulevard (#5) to provide a dedicated right-turn lane
- ▶ Implementation of protected/permitted left-turn phasing for the westbound approach of Exposition Avenue & Sable Boulevard (#6)
- ▶ Construction of eastbound and westbound left-turn lanes and a southbound right-turn lane at Chambers Road & Exposition Avenue (#8)
 - Protected/permitted phasing for eastbound and westbound left-turns
- ▶ Construction of a traffic signal at Chambers Road & Center Avenue (#9) with protected/permitted phasing for northbound and southbound left-turns
- ▶ Construction of a new westbound left-turn lane along Alameda Parkway at Fraser Court (#14)

Table 9 displays 95th percentile queue lengths for morning and evening peak hours. The table also display storage length criteria as defined by the Colorado State Highway Access Code (SHAC) and storage length recommendations. SHAC criteria shown in the tables assumed the following facility classifications for study area roadways:

- ▶ **NR-A:** Alameda Avenue/Parkway, Chambers Road
- ▶ **NR-B:** Sable Boulevard
- ▶ **NR-C:** Alameda Drive, Exposition Avenue, Centrepoint Drive, Center Avenue
- ▶ **Not Applicable:** All other roadways

Notes: Movements are first identified by direction then by movement (i.e., EBL = Eastbound Left-Turn)

EB: Eastbound, **WB:** Westbound, **NB:** Northbound, **SB:** Southbound

L: Left-turn, **T:** Through, **R:** Right-turn

m: The reported 95th percentile queue length is metered by an upstream signalized intersection

#: The reported 95th percentile volume exceeds the movement capacity

Blue Highlight: Recommended storage length is longer than existing conditions

As shown in **Table 9**, several locations have existing turn lanes that do not meet SHAC storage criteria but would adequately contain anticipated vehicle queues forecasted in the Future (2040) Total Traffic scenario. However, some recommended storage lengths shown in the tables are longer than existing conditions and would require improvements. These locations are discussed further in the following sections.

4. Alameda Parkway & Chambers Road

Several turn lane modifications should be considered to address forecasted queues beginning in the Future (2040) Background Traffic scenario. The eastbound left-turn lanes should be modified to provide 250 feet of storage in the left lane and 300 feet of storage in the right lane. The westbound left-turn lanes should be modified to increase storage to 200 feet in the left lane. Northbound left-turn lanes should be modified to provide 225 feet of storage in the left lane and 400 feet of storage in the right lane. Finally, southbound left-turn lanes should be modified to provide 325 feet of storage in the left lane and 500 feet of storage in the right lane. Significant modifications to the median would be required. Even with these modifications, forecasted queues might still spill out of the available storage length during peak hours.

New northbound and westbound right-turn lanes should be constructed with 230 feet of storage length, subject to change based on availability of right-of-way and other design constraints. These improvements should be completed to address traffic volume growth in the Future (2040) Background Traffic scenario.

5. Centrepoint Drive & Sable Boulevard

The westbound left-turn lane should be restriped to provide 125 feet of storage. No median reconstruction would be required. This improvement should be completed to address Metro Center site-generated traffic introduced in the Existing Plus Site scenario.

6. Exposition Avenue & Sable Boulevard

The southbound left-turn lane should be restriped to provide 275 feet of storage. No median reconstruction would be required. This improvement should be completed to address traffic volume growth in the Future (2040) Background Traffic scenario.

8. Exposition Avenue & Chambers Road

Several turn lane modifications should be considered to address forecasted queues beginning in the Future (2040) Background Traffic scenario. The new eastbound left-turn lane should be constructed with 375 feet of storage. The eastbound right-turn lane should be restriped to provide 425 feet of storage. The proposed westbound left-turn lane should be constructed with 100 feet of storage length. Finally, the proposed southbound right-turn lane should be constructed with 230 feet of storage length. Modifications to curb lines in the northwest corner may be required to implement these turn lane improvements.

14. Alameda Parkway & Fraser Court

The proposed westbound left-turn lane should be constructed with 275 feet of storage. This distance would also accommodate storage and taper lengths for the eastbound left-turn lanes at the Alameda Parkway & Chambers Road (#4) intersection. Significant modifications to the median would be required to construct this left-turn lane.

V.D Safety

Recommendations for Existing Conditions

Based on the evaluations shown in **Section II.F**, the following improvements should be considered to mitigate existing safety conditions.

- ▶ Adjust left-turn phasing at several study intersections to use protected-only phasing during more times of the day:
 1. Alameda Avenue & Sable Boulevard
 6. Exposition Avenue & Sable Boulevard
 8. Exposition Avenue & Chambers Road
- ▶ Consider restricting access at Alameda Avenue & Municipal Center Access (#2) to prohibit southbound left-turns except for emergency vehicle access.
- ▶ Review interval clearances and progression to reduce red-light running and improve signal visibility for several study intersections:
 3. Alameda Avenue/Parkway & Alameda Drive
 4. Alameda Parkway & Chambers Road
 5. Centrepoint Drive & Sable Boulevard
- ▶ Consider sight distance improvements at Center Avenue & Chambers Road (#9), or consider signalization based on crash experience warrants from MUTCD.

Recommendations for Proposed Site

The Metro Center Master TIS identified several recommendations for site design focused on safety for all road users which still apply to the Master Plan Amendment:

- ▶ Construct proposed intersections within the site at or close to right angles.
- ▶ Visibly mark crosswalks and install warning signs to alert drivers to the presence of pedestrian activity around the heavily trafficked pedestrian plazas.
- ▶ Design bicycle facilities using guidance from the NACTO Urban Bikeway Design Guide and consider design features aimed at enhancing safety.

In general, the roadway network within the site should be designed to encourage slower speeds through traffic calming techniques. Such techniques may include narrow travel lanes, curb extensions, high visibility crosswalks and/or raised crossings and intersections, among others. All these techniques should focus on enhancing bicycle/pedestrian visibility and safety throughout the site, ensuring that the development can effectively support multimodal travel.

V.E Traffic Control Devices

Recommended improvements shown in **Section V.A** include several modifications to traffic control devices to improve traffic operations and safety. **Table 10** summarizes proposed traffic control modifications at intersections but does not include the new intersections proposed as part of the Metro Center development.

Table 10. Traffic Control Recommendations

#	Intersection	Existing Traffic Control	Recommended Changes	Required Timeline	MUTCD Signal Warrants
3	Alameda Ave/Pkwy & Alameda Dr	Signal	Add Prot/Perm for WBL	Existing Plus Site	N/A
4	Alameda Pkwy & Chambers Rd	Signal	Add Overlap for WBR	Existing	N/A
			Add Overlap for NBR	Future (2040) Background	
6	Exposition Ave & Sable Blvd	Signal	Add Prot/Perm for WBL	Existing (Completed)	N/A
8	Exposition Ave & Chambers Rd	Signal	Prohibit NBU	Existing	N/A
			Add Prot/Perm for EBL	Future (2040) Background	
			Add Prot/Perm for WBL	Future (2040) Background	
9	Center Ave & Chambers Rd	Stop-Control (Center Ave)	Signalize	Existing Plus Site	8-Hr: Existing 4-Hr: Existing Pk Hr: Existing
			Add Prot/Perm for NBL	Existing Plus Site	
			Add Prot/Perm for SBL	Existing Plus Site	

Notes: **Prot/Perm:** Protected/Permitted left-turn phasing

Movements are first identified by direction then by movement (i.e., EBL = Eastbound Left-Turn)

EB: Eastbound, **WB:** Westbound, **NB:** Northbound, **SB:** Southbound

U: U-turn, **L:** Left-turn, **T:** Through, **R:** Right-turn

As shown in **Table 10**, a proposed traffic signal for the Center Avenue & Chambers Road (#9) intersection meets signal warrants based on existing traffic volumes, specifically considering westbound Center Avenue. However, signalization is not recommended until the Existing Plus Site scenario with the introduction of site-generated traffic from Metro Center. Unsignalized movement LOS still meets criteria from Aurora's TIS guidelines in existing conditions despite meeting signal warrants.

Table 10 does not display any proposed traffic control changes at the Exposition Avenue & Centrepoin Drive (#7) intersection, despite the previous consideration of a roundabout in the *Metro Center Master TIS*. This intersection should be evaluated further before committing to traffic control changes. Specifically, Aurora may further evaluate to determine feasibility with respect to geometry, right-of-way, sight distance, bicycle accommodations, etc.

VI. Conclusions

Compared to the previous *Metro Center Master TIS*, the proposed development plan associated with the Master Plan Amendment is expected to have similar traffic impacts and proposed mitigations as documented in this TIS. The proposed development would occupy approximately 60 acres south of Alameda Avenue/Parkway between Sable Boulevard and Chambers Road and would include:

- ▶ 2,130 multifamily DUs
- ▶ 49.88 KSF commercial/mixed-use
- ▶ 3.5 KSF office space

These land uses are expected to generate up to 14,060 daily trips, including about 1,040 in the morning peak hour and about 1,315 in the evening peak hour. However, with considerations of internal trip-making, pass-by trips, and mode share reductions, the site would generate about 9,485 net external daily vehicle trips, nearly 845 in the morning peak hour and 920 in the evening peak hour. Additionally, the development would generate about 860 internal daily vehicle trips, 20 in the morning peak hour and 48 in the evening peak hour. Site-generated vehicle trips from Metro Center would decrease under the Master Plan Amendment compared to what was evaluated in the *Metro Center Master TIS*. Internal vehicle trips would also decrease due to the change in development characteristics toward more residential land uses.

Improvements to the external and proposed internal roadway network required to mitigate anticipated background traffic growth and the proposed development. **Table 11** summarizes these improvements. While many improvements are consistent with recommendations from the *Metro Center Master TIS*, additional improvements have been identified to address both background traffic growth and site-generated traffic.

In total, the changes to the site plan proposed under the Master Plan Amendment would result in additional traffic volume using the Alameda Avenue/Parkway & Alameda Drive (#3) and Centrepoint Drive & Sable Boulevard (#5) intersections. Additionally, consolidation of access to Parcel A1 via Alameda Avenue may result in additional U-turn movements at Alameda Avenue & Sable Boulevard (#1) and Alameda Avenue & Municipal Center Access (#2). However, the recommended improvements shown in **Table 13** would address the traffic operations and safety concerns introduced by these changes.

Table 11. Summary of Recommended Improvements

#	Intersection	Improvement Description	Timeline
1	Alameda Ave & Sable Blvd	Consider restricting all left-turns to protected-only phasing during more times of day to address Approach Turn crashes.	Existing
		Adjust signal timing to provide more green time for eastbound and westbound Alameda Ave through movements.	Future (2040) Background
2	Alameda Ave & Municipal Center Access	Consider restricting southbound access to prohibit left-turns with exceptions for emergency vehicles to address Broadside crash frequency.	Existing
3	Alameda Ave/Pkwy & Alameda Dr	Adjust cycle length during evening peak hour to match 135-second cycle at Alameda Pkwy & Chambers Rd (#4).	Existing
		Improve sight distance, signal visibility, and review signal timing parameters to address Broadside crash frequency.	Existing
		Implement protected/permitted phasing for westbound left-turns.	Existing Plus Site
		Increase storage length for northbound left-turns.	Existing Plus Site

Table II. Summary of Recommended Improvements

#	Intersection	Improvement Description	Timeline
4	Alameda Pkwy & Chambers Rd	Construct a westbound right-turn lane and implement an overlap phase.	Existing
		Improve sight distance, signal visibility, and review signal timing parameters to address Broadside crash frequency.	Existing
		Construct a northbound right-turn lane and implement an overlap phase.	Future (2040) Background
		Increase storage length for all left turn lanes.	Future (2040) Background
5	Centrepoint Dr & Sable Blvd	Improve sight distance, signal visibility, and review signal timing parameters to address Broadside crash frequency.	Existing
		Restripe westbound Centrepoint Dr to provide dedicated left-turn, through, and right-turn lanes.	Existing Plus Site
		Increase storage length for westbound left-turns.	Existing Plus Site
6	Exposition Ave & Sable Blvd	Implement protected/permitted phasing for westbound left-turns (already completed), consider restricting all left-turns to protected-only during more times of day.	Existing
		Increase storage length for southbound left-turns.	Future (2040) Background
8	Exposition Ave & Chambers Rd	Prohibit northbound U-turns, allowing the eastbound right-turn overlap phase to operate more effectively.	Existing
		Install FYA signals and restrict left-turns to protected-only phasing during more times of day to address Approach Turn crashes.	Existing
		Construct dedicated eastbound and westbound left-turn lanes, and implement protected/permitted phasing for both.	Future (2040) Background
		Construct a dedicated southbound right-turn lane.	Future (2040) Background
		Increase storage length for eastbound right-turns, construct new turn lanes with adequate storage length.	Future (2040) Background
9	Center Ave & Chambers Rd	Improve sight distance, especially for westbound Center Avenue, consider signalization based on Crash Experience.	Existing
		Construct a new traffic signal with protected/permitted phases for northbound and southbound left-turns.	Existing Plus Site
14	Alameda Pkwy & Fraser Ct	Construct a new westbound left-turn lane.	Existing Plus Site

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 2 (2%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 38.2

Intersection LOS: D

Intersection Capacity Utilization 79.0%

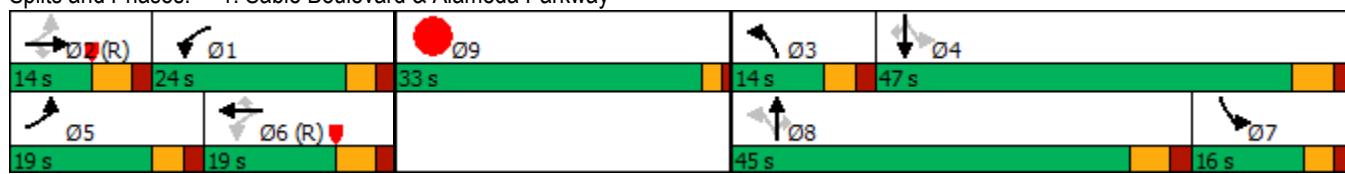

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 116 (97%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.94

Intersection Signal Delay: 37.7

Intersection LOS: D

Intersection Capacity Utilization 69.3%

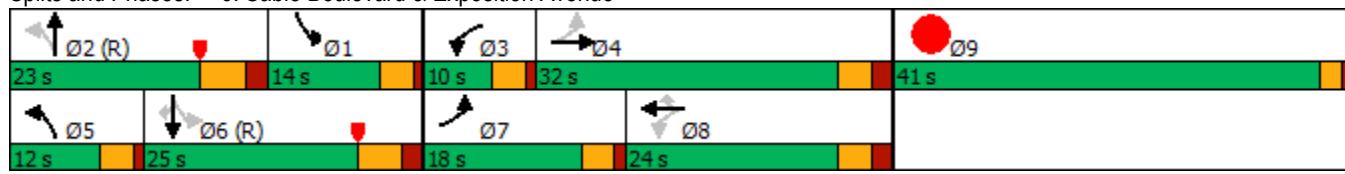

ICU Level of Service C

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 104 (79%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.78

Intersection Signal Delay: 33.6

Intersection LOS: C

Intersection Capacity Utilization 76.4%

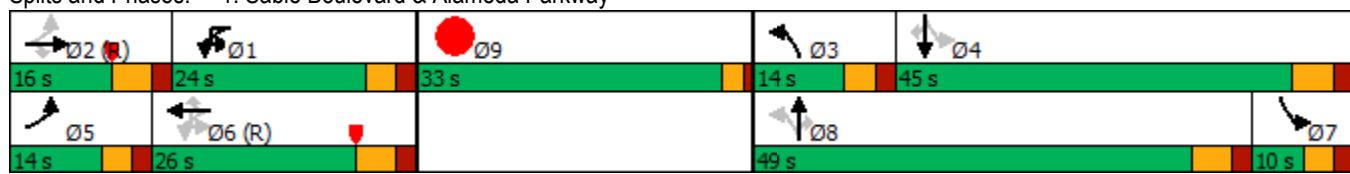

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 2 (2%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.75

Intersection Signal Delay: 39.9

Intersection LOS: D

Intersection Capacity Utilization 81.4%

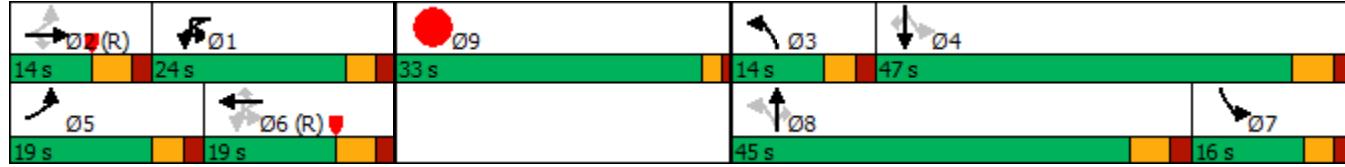

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 104 (79%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.98

Intersection Signal Delay: 40.2

Intersection LOS: D

Intersection Capacity Utilization 86.4%

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 104 (79%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.98

Intersection Signal Delay: 40.1

Intersection LOS: D

Intersection Capacity Utilization 86.4%

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 2 (2%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.13

Intersection Signal Delay: 73.5

Intersection LOS: E

Intersection Capacity Utilization 92.4%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

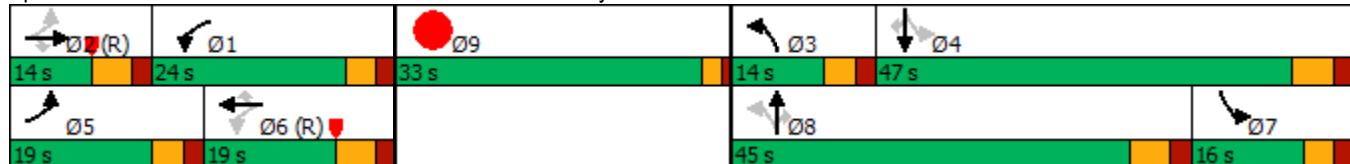

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 2 (2%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.23

Intersection Signal Delay: 97.7

Intersection LOS: F

Intersection Capacity Utilization 94.7%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

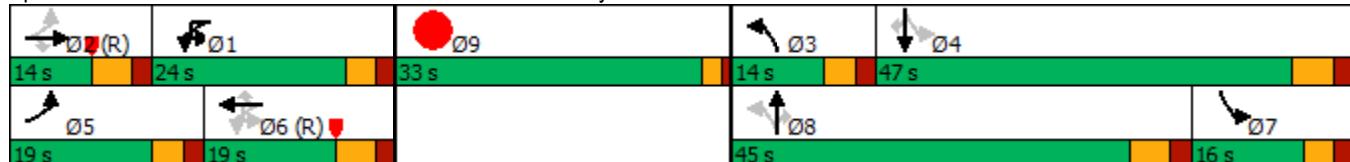

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 116 (97%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.92

Intersection Signal Delay: 63.9

Intersection LOS: E

Intersection Capacity Utilization 79.9%

ICU Level of Service D

Analysis Period (min) 15

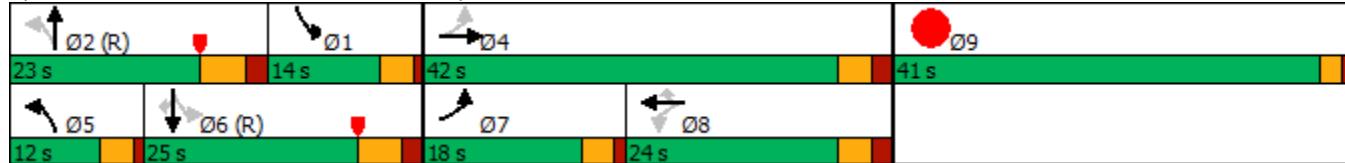

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Cycle Length: 132

Actuated Cycle Length: 132

Offset: 104 (79%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.08

Intersection Signal Delay: 52.9

Intersection LOS: D

Intersection Capacity Utilization 88.6%

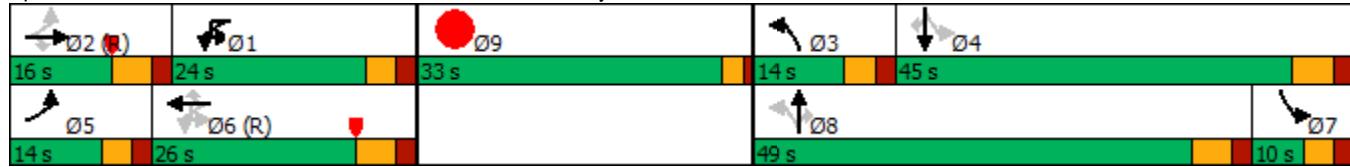

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Appendix E. Center Ave & Chambers Rd Signal Warrant Analysis

May 22, 2024

Mr. Bill Parkhill
Navona Investors, LLC
631 High Street
Denver, CO 80218

RE: Metro Center Master Plan Amendment – Aurora, Colorado
Center Avenue & Chambers Road Traffic Signal Warrants
FHU No. 124134-01

Dear Mr. Parkhill:

Felsburg Holt & Ullevig (FHU) has prepared this letter to document signal warrant analyses for the Center Avenue & Chambers Road intersection on the southeast corner of the Metro Center site. We have conducted these analyses at the request of City of Aurora staff in support of the Traffic Impact Study (TIS) prepared for the Metro Center Master Plan Amendment. We have prepared this letter to document new traffic signal warrant analyses for the intersection based on new traffic counts conducted at the intersection in April 2024 and on traffic volume forecasts presented in the Metro Center Master Plan Amendment TIS.

Methodology

The Manual on Uniform Traffic Control Devices (MUTCD) identifies several warrants justifying the use and installation of traffic control signals. Three of these warrants are based on traffic volume:

- Warrant 1 – Eight-Hour Vehicular Volume
- Warrant 2 – Four-Hour Vehicular Volume
- Warrant 3 – Peak Hour

Using April 2024 traffic counts and traffic volume forecasts from the Metro Center Master Plan Amendment TIS, FHU evaluated each of these three volume-based warrants for Existing Conditions, Existing Plus Site, Future (2040) Background Traffic, and Future (2040) Total Traffic scenarios to understand the timeline of when the Center Avenue & Chambers Road intersection may warrant signalization based on traffic volume.

Warrant Criteria Thresholds

The MUTCD provides the option that, if the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 40 miles per hour (MPH), or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the thresholds for traffic volumes meeting Warrants 1, 2, and 3 may be reduced to 70 percent of the original values. The posted speed limit on Chambers Road (the major street) is 40 MPH, and the intersection is not located within the built-up area of an isolated community. Therefore, we did not use the 70 percent thresholds in the signal warrant analyses.

MUTCD thresholds also vary based on the lane configurations of the major and minor streets. Chambers Road has four approach lanes in each direction (1 left-turn lane, 2 through lanes, and 1 shared through/right-turn lane). Center Avenue has single approach lanes in each direction (1 shared left-turn/through/right-turn lane). Based on this configuration, it is appropriate to use the MUTCD thresholds for intersections with 2-or-more lanes on the major street and 1 lane on the minor street.

Minor Street Right-Turn Reductions

The MUTCD notes that traffic signal warrant studies should consider the effects of the right-turn vehicles from the minor-street approaches. Engineering judgment should be used to determine what, if any, portion of the right-turn traffic is subtracted from the minor-street traffic count when evaluating the count against the signal

May 22, 2024

Metro Center Master Plan Amendment (**FHU No. 124134-01**)

Center Avenue & Chambers Road Traffic Signal Warrants

Page 2

warrants. Because of the single-lane approaches, it is expected that approximately 25 percent of right-turning traffic would not benefit from the presence of a traffic signal as they would be able to turn right on red and avoid incurring additional delay.

Traffic Volume Forecasts

Turning movement counts for the Center Avenue & Chambers Road intersection were conducted in April 2024 and included the period from 6:00 a.m. to 7:00 p.m. Consistent with the conditions evaluated in the Master Plan Amendment TIS, we applied a uniform annual growth rate of 1.5 percent to the entire study area to develop traffic volume forecasts for the Future (2040) Background Traffic scenario.

Existing Plus Site and Future (2040) Total Traffic scenario traffic volume forecasts included existing/background traffic volumes and site-generated traffic from proposed development within Metro Center. Although site-generated traffic was evaluated only during morning and evening peak hours in the Master TIS, the Institute of Transportation Engineers provides tools within *Trip Generation* (11th Edition) to estimate distribution of site-generated trips over typical weekdays for most land-use types. We used these tools to approximate the portion of traffic related to Metro Center at the Center Avenue & Chambers Road intersection in 15-minute increments relative to the sum of morning and evening peak hour trips for the site.

Signal Warrant Analyses

The following subsections describe the results of signal warrant analyses for Center Avenue & Chambers Road.

Warrant I – Eight-Hour Vehicular Volume

Warrant I is satisfied when, for eight or more hours of an average day, traffic volumes along the major street (total of both approaches) and the higher-volume minor street approach exceed the threshold values specified in Table 4C-1 of the MUTCD. The threshold values for Condition A – Minimum Vehicular Volume are useful when the high approach volumes are the primary reason for signalization. The Condition B – Interruption of Continuous Traffic thresholds are used when major street volumes cause minor street vehicles to suffer excessive delay or experience conflicts when attempting to cross the major street. These threshold values are adjusted downward to account for higher roadway speeds or rural (<10,000 population) conditions. These thresholds also change relative to the number of lanes provided along each intersection approach. Warrant I is satisfied when Condition A **or** Condition B is met. Warrant I is also satisfied when 80 percent of the threshold traffic volumes in Condition A **and** Condition B are exceeded.

Table I summarizes Warrant I analyses. As shown, traffic volumes in all four scenarios would meet criteria for Condition B – Interruption of Continuous Traffic, indicating that the intersection **currently** meets Warrant I based on traffic counts from April 2024.

Of note, the addition of traffic volumes from proposed development within Metro Center would not change the higher minor street approach. Westbound Center Avenue would still have higher approach volumes than those of eastbound Center Avenue.

May 22, 2024

Metro Center Master Plan Amendment (**FHU No. 124134-01**)

Center Avenue & Chambers Road Traffic Signal Warrants

4:45 p.m. – 5:45 p.m.	3,203	97	3,320	95	4,065	125	4,185	125
Criteria A	600	150	600	150	600	150	600	150
Criteria B	900	75	900	75	900	75	900	75

Notes: 8-hour Warrant Criteria for a Major Street with 2+ Lanes and a Minor Street with 1 Lane

Blue Highlight: Meets Criteria A & B

Green Highlight: Meets Criteria B

Warrant 2 – Four-Hour Vehicular Volume

Warrant 2 is fulfilled when traffic volumes for the major street (total of both approaches) and the higher volume minor street plot above the threshold guidelines as represented on Figure 4C-1 or 4C-2 of the MUTCD for any four hours of an average day for the existing combination of approach lanes.

Attachment I summarizes the four-hour vehicular volumes and graphs for Warrant 2. As shown, traffic volumes in all four scenarios would meet criteria for Warrant 2 (the appropriate threshold line for this intersection is highlighted in yellow), indicating that the intersection **currently** meets Warrant 2.

Of note, the addition of traffic volumes from proposed development within Metro Center would not change the higher minor street approach. Westbound Center Avenue would still have higher approach volumes than those of eastbound Center Avenue.

Warrant 3 – Peak Hour

Warrant 3 is intended for application where traffic conditions are such that for one hour of the day minor street traffic suffers undue delay in entering or crossing the major street. Warrant 3 may also be satisfied when traffic volumes for the major street (total of both approaches) and the higher volume minor street approach plot above the threshold guidelines as represented on Figure 4C-3 or 4C-4 of the MUTCD for the existing combination of approach lanes during the peak hour of the day.

The 2009 Edition of the MUTCD includes the following statement in the Peak Hour Warrant description:

This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.

May 22, 2024

Metro Center Master Plan Amendment (**FHU No. 124134-01**)

Center Avenue & Chambers Road Traffic Signal Warrants

Page 4

As a result of this statement, Warrant 3 must be used with caution and should not be used for typical public street intersections. Therefore, this warrant is not applicable to Center Avenue & Chambers Road.

Attachment 2 summarizes the peak hour vehicular volumes and graphs for Warrant 3. As shown on the graphs, traffic volumes in all four scenarios would meet criteria for Warrant 3 (the appropriate threshold line for this intersection is highlighted in yellow). This indicates that the intersection **currently** meets Warrant 3. However, MUTCD's clarification for applying Warrant 3 as described previously precludes the use of this warrant for justifying the signalization of the Center Avenue & Chambers Road intersection.

Of note, the addition of traffic volumes from proposed development within Metro Center would not change the higher minor street approach. Westbound Center Avenue would still have higher approach volumes than those of eastbound Center Avenue.

Summary

Traffic volume forecasts for the Center Avenue & Chambers Road intersection based on the Metro Center Master Plan Amendment TIS indicate that signalization of the intersection is **currently** warranted based on April 2024 traffic counts using Warrant 1 – Eight-Hour Vehicular Volume and Warrant 2 – Four-Hour Vehicular Volume from the MUTCD. Existing traffic volumes also meet Warrant 3 – Peak Hour, but the application of this warrant should not be considered for the Center Avenue & Chambers Road intersection.

Future traffic volumes anticipated at the intersection also indicate that a traffic signal would be warranted after proposed development occurs in Metro Center. However, it is important to note that new development is not expected to change the higher minor street approach. Westbound Center Avenue would still have higher approach volumes than those of eastbound Center Avenue.

The results of this signal warrant analysis are consistent with the outcomes and recommendations of the Metro Center Master Plan Amendment TIS. Although existing traffic operations meet LOS criteria for Aurora, signalization of this intersection should be considered as soon as possible to accommodate minor street traffic from Center Avenue, both from anticipated development on the west side of Chambers Road and from commercial and residential land uses on the east side of Chambers Road.

If you have any questions about this letter, please contact Lyle DeVries (lyle.devries@fhueng.com) or Ryan Saline (ryan.saline@fhueng.com) or call 303-721-1440.

Sincerely,

FELSBURG HOLT & ULLEVIG
