I. INTRODUCTION

I.A. Summary

Aurora Public Schools (APS) is proposing to develop a freezer facility on an approximately 4.5-acre site in the southeast quadrant of the intersection of Airport Boulevard and Centretech Parkway. The site location is located amongst a larger APS campus which houses the school district's purchasing and transportation departments, including a bus storage lot, along with the Edna and John W. Mosley School and the Aurora Quest School. **Figure 1** illustrates the location of the site and the adjacent primary roadway network. The proposed facility would consist of a 54 thousand square feet (KSF) building. Primary access to the facility will be provided onto Centretech Parkway along the north side of the site. The site will connect to a second existing access further east on Centretech Parkway. **Figure 2** shows the current site plan which depicts building location and site access points. A short-term scenario representing completion of the site in the year 2025 and a long-term future scenario examining the traffic impacts within the context of the year 2050 were analyzed.

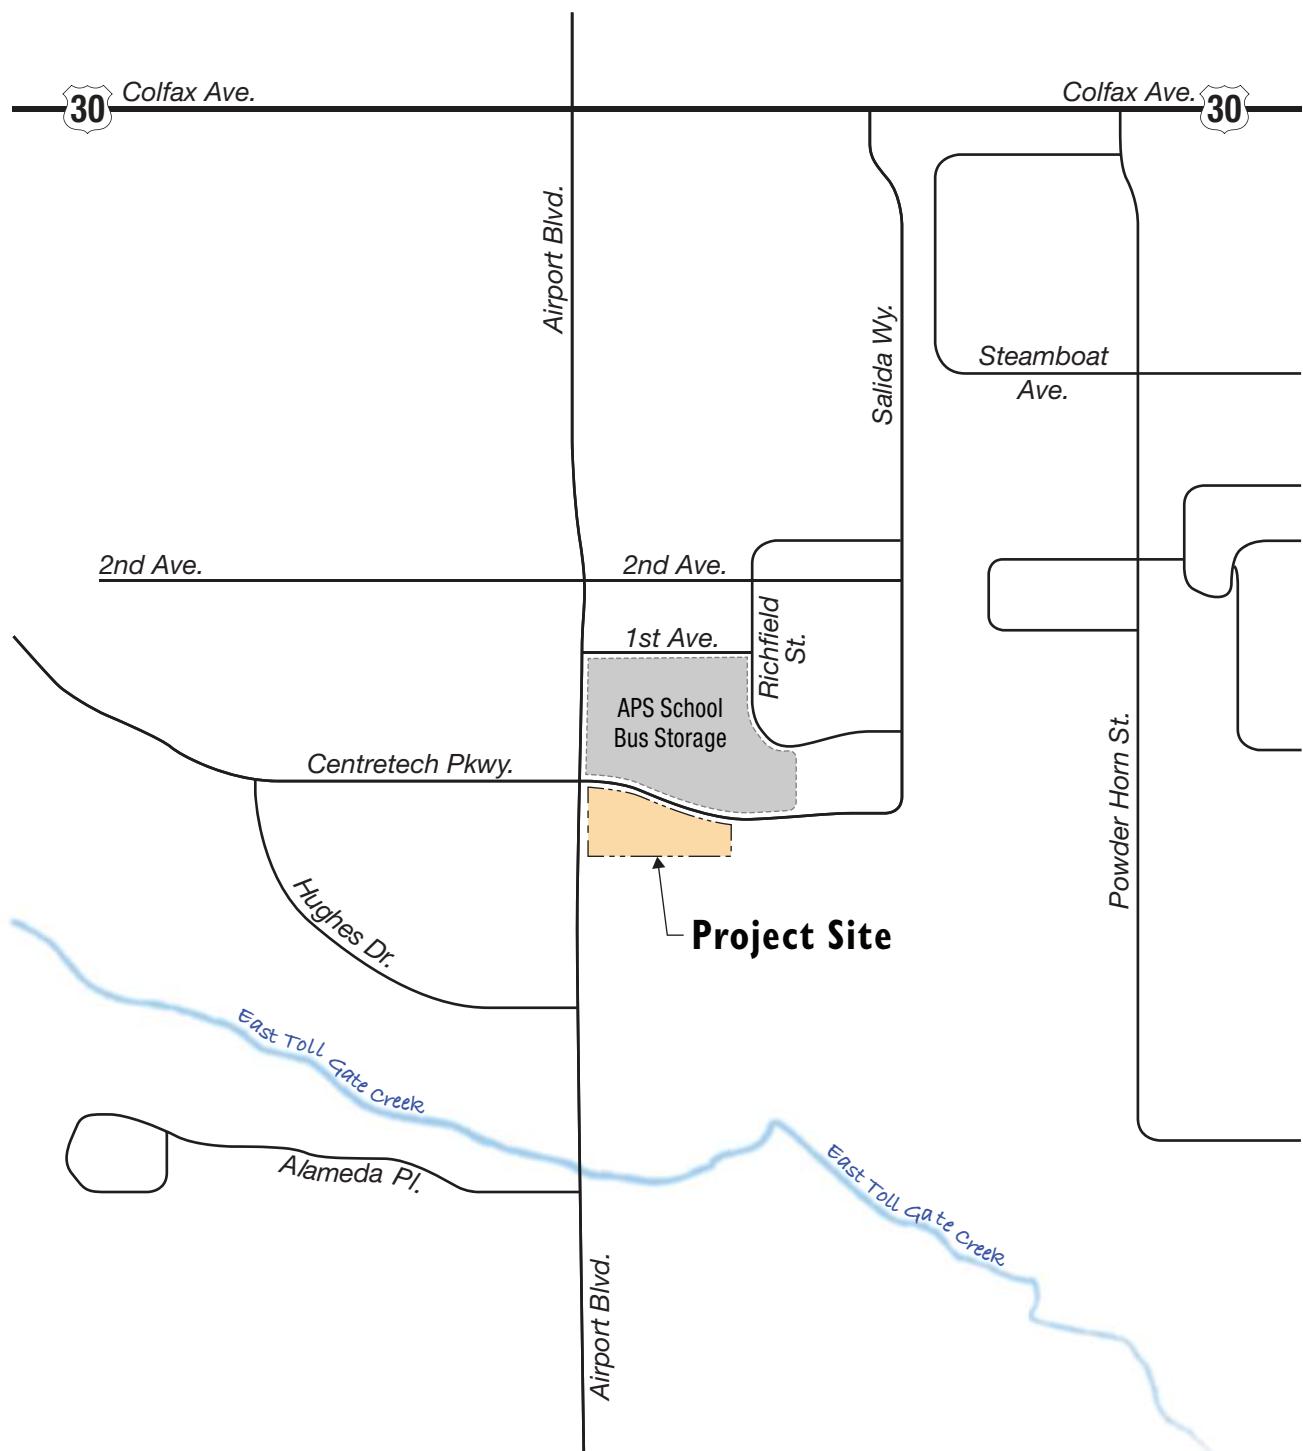

I.B. Scope of Services

The purpose of this Transportation Impact Study (TIS) is to estimate the potential impacts specific to the proposed development and to identify any resultant required roadway and/or intersection improvements and traffic control needs. This report also includes a queueing analysis for study intersections. The primary focus for traffic operations is at the following intersections:

- Airport Boulevard & Centretech Parkway
- Centretech Parkway & West Site Access (Proposed)
- Centretech Parkway & School Bus Access
- Centretech Parkway & East Site Access

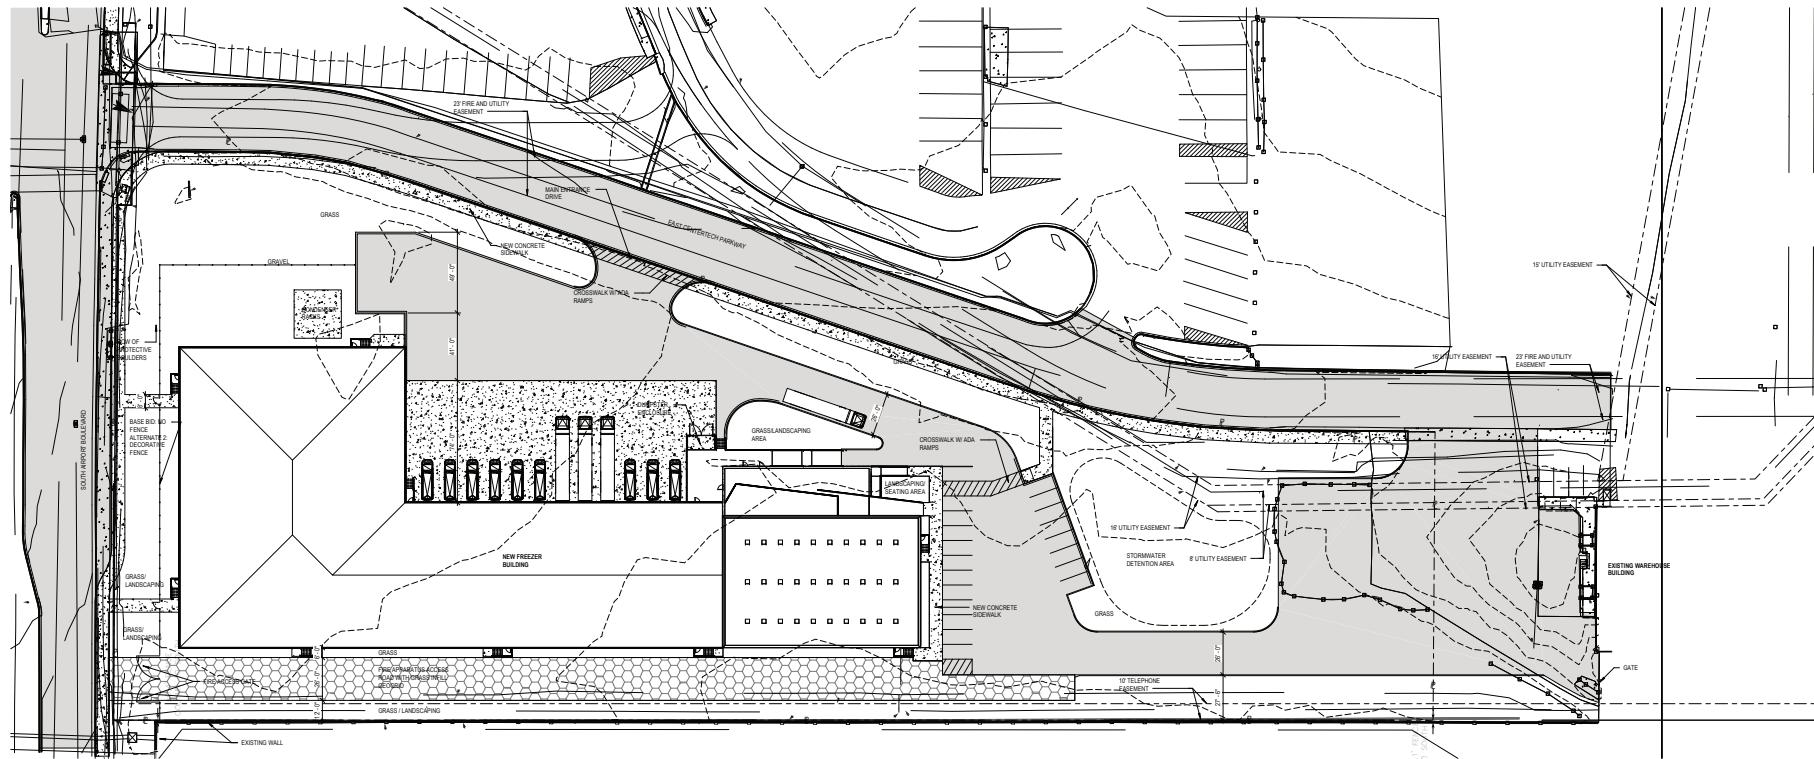

The study will evaluate the following time periods:

- Existing (2024) AM and PM peak hours.
- Buildout (2025) of the development for AM and PM peak hours.
- Future (2050) of the development for AM and PM peak hours.

NORTH

Vicinity Map

NORTH

FIGURE 2
Site Plan

II. EXISTING CONDITIONS

II.A. Surrounding Land Use

The site of the proposed freezer facility is surrounded by a mix of land uses including residential neighborhoods, government buildings, warehouses, industrial buildings, office parks, and vacant land. The Aurora Public Schools Transportation Department has a bus storage lot located to the north of the site and the Edna and John W. Mosley P-8 School is east of the bus storage facility. There are several more schools to the north. The Buckley Space Force Base is also located east of the site, but it cannot be accessed using Centretech Parkway. South of the site is the Buckley Family housing development, which has approximately 150 single family homes. To the west of the site across Airport Boulevard is the Raytheon office park.

II.B. Transportation Network

Roadways

The existing transportation network near the site includes the intersection of Airport Boulevard and Centretech Parkway. These roadways serve as the western and northern boundaries of the site respectively. Airport Boulevard exists as a divided six-lane major-arterial. Approximately 4 miles north of the site Airport Boulevard merges with Peña Boulevard and continues to Denver International Airport. South of the site Airport Boulevard becomes Buckley Road after crossing Alameda Parkway. Centretech Parkway is a two-lane collector roadway with a center left turn lane. East of the site Centretech Parkway turns north and becomes Salida Way after crossing 2nd Avenue. West of the site Centretech parkway turns northeast and serves the Centretech neighborhood.

Traffic Volumes

Existing traffic volumes in the vicinity of the site are presented on **Figure 3**. The traffic count data can also be found in the **Appendix**. Turning movement counts were collected on May 7th, 2024 at the intersection of Airport Boulevard with Centretech Parkway and at the intersection of Centretech Parkway with the school bus storage access. A daily count was collected on Airport Boulevard north of Centretech Parkway, also on May 7th, 2024. Daily traffic volumes along Airport Boulevard were found to be 38,400 vehicles per day, with 21,700 vehicles traveling in the northbound direction and 16,700 vehicles traveling in the southbound direction. The AM peak hour for the study area network was determined to be from 7:15 to 8:15 AM and the PM peak hour was from 3:30 to 4:30 PM. Trucks were counted separately from passenger vehicle traffic to develop truck percentages for the study area. The calculated heavy vehicle (HV) percentage was less than 1%. For the analysis a 1% HV percentage was assumed to provide an accurate reflection of the existing roadway network. The existing northbound right-turn volume at the intersection of Airport Boulevard and Centretech Parkway is 174 vehicles during the AM peak hour. There is not currently an exclusive right-turn lane.

Traffic Operations

Calculations were carried out to assess operations given current traffic demands. These were conducted using techniques documented in the *Highway Capacity Manual (HCM) 6th Edition*, (Transportation Research Board, 2016) using the existing traffic volumes and intersection geometry. Level of Service (LOS) is a qualitative measure of traffic operational conditions, based on roadway capacity and vehicle

delay. Levels of service are described by a letter designation ranging from A to F, with LOS A representing free-flow travel, while LOS F represents congested conditions. For signalized intersections, LOS is calculated for the entire intersection while LOS for unsignalized intersections is calculated for movements that must yield right-of-way to other traffic movements.

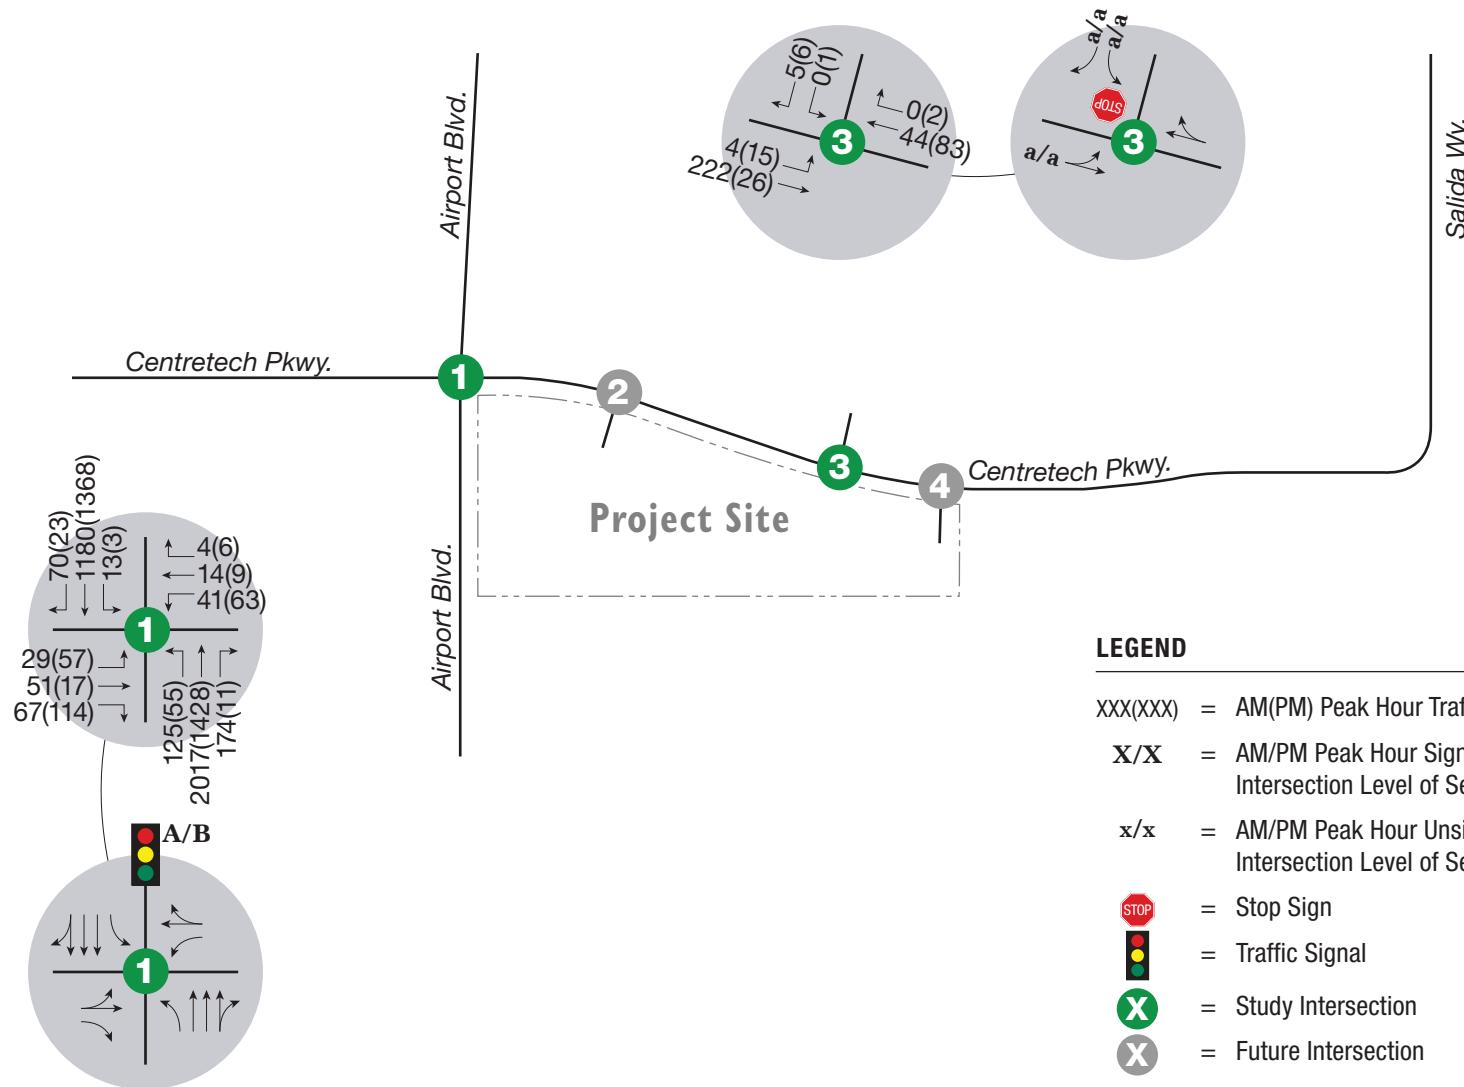

Table I summarizes LOS criteria for signalized and unsignalized (stop sign controlled) intersections.

Table I. Level of Service (LOS) Criteria

Level of Service	Average Control Delay per Vehicle (sec/veh)	
	Signalized Intersections	Stop Sign Controlled Intersections
A	≤ 10	≤ 10
B	> 10 to 20	> 10 to 15
C	> 20 to 35	> 15 to 25
D	> 35 to 55	> 25 to 35
E	> 55 to 80	> 35 to 50
F	> 80	> 50

HCM 6th Edition, Exhibit 19-8 & Exhibit 20-2

The signalized intersection of Airport Boulevard and Centretech Parkway operates at LOS A during the AM peak and LOS B during the PM Peak for the existing condition. All movements on the stop-controlled bus access intersection operate at LOS A during both peak hours.

III. PROPOSED CONDITIONS

III.A. Site Trip Generation

Trip generation average rates from the *Institute of Transportation Engineers' (ITE) Trip Generation Manual, Tenth Edition, 2017*, were utilized to estimate the traffic generated by the site. Anticipated site use was analyzed from the provided site plan using the appropriate land use types from the *Trip Generation Manual*. Land use code (LUC) 157, which represents high cube cold storage warehouses, was not used because buildings that fall into this category are generally over 200 KSF. The current proposed freezer facility will have a gross floor area of 54 KSF so LUC 150, which covers general warehousing, was used. **Table 2** shows the trip generation for the proposed development, which is estimated to generate 125 trips per day, with 30 vehicle-trips during the AM peak period and 33 vehicle-trips during the PM peak period when built out.

Table 2. Trip Generation Summary

Land Use	Intensity	ITE Code	Daily Trips	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Warehousing	54 KSF	150	125	23	7	30	9	24	33

III.B. Trip Distribution and Traffic Assignment

Trip distribution estimates for this site were based on existing traffic volumes on the eastern leg of and the expected use of the freezer facility. The following distribution percentages were used to assign site generated vehicle-trips to the adjacent roadway network:

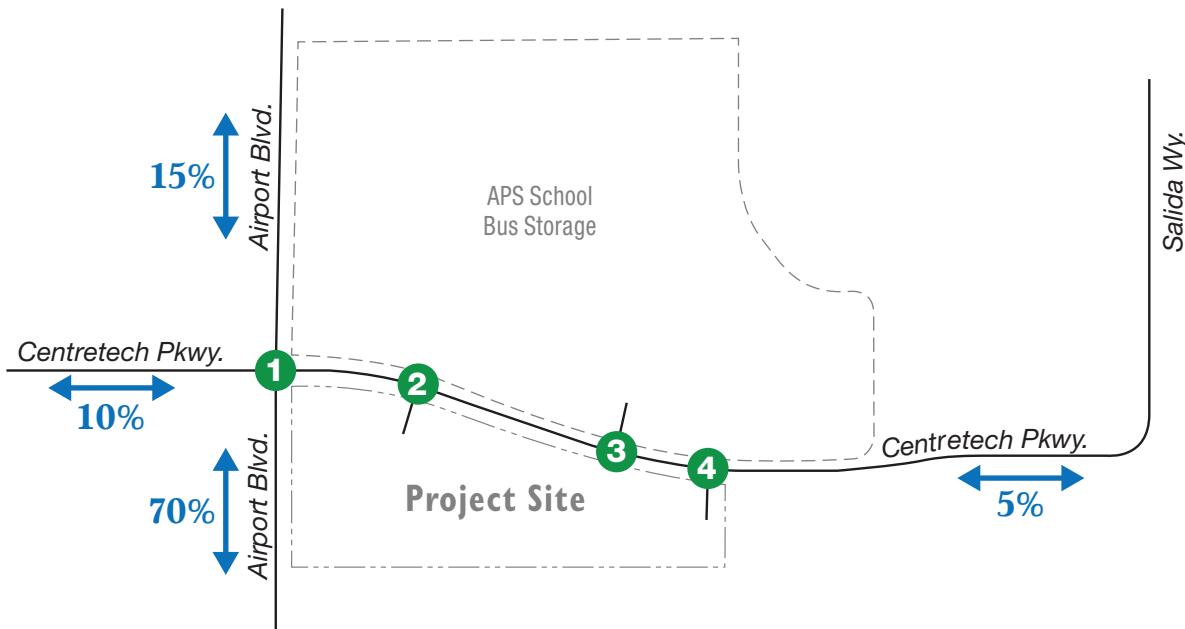

- 15% to/from the north via Airport Boulevard
- 70% to/from the south via Airport Boulevard
- 10% to/from the west via Centretech Parkway
- 5% to/from the east via Centretech Parkway

Figure 4 shows the site-trip distribution percentages for the overall development. The distribution percentages were used to assign site generated vehicle-trips from the trip generation table above. These percentages dictate the vehicle movements to and from the site. **Figure 4** also shows the anticipated site generated traffic volumes for intersections near the freezer facility.

III.C. Background Growth

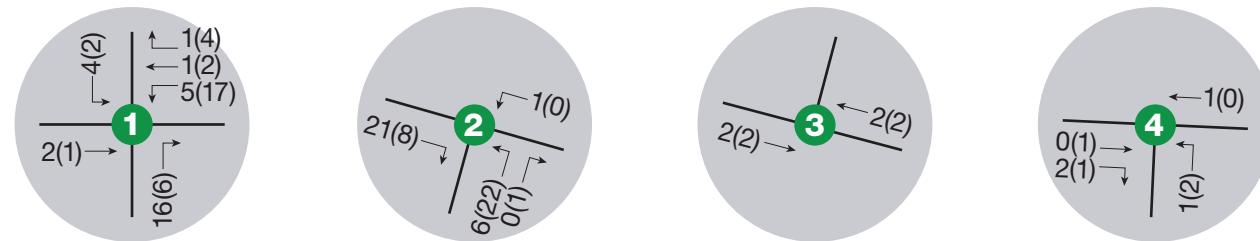

The Denver Regional Council of Governments (DRCOG) produces a travel demand model. The 2023 and 2050 average daily traffic (ADT) volumes from that model were used to estimate the growth rate of traffic on Airport Boulevard. In 2018, the City of Aurora completed the NEATS Refresh study, which provides year 2040 and regional buildout transportation recommendations for the roadways and multimodal transportation system within the study area. The NEATS Refresh study area encompassed a regional area extending from approximately between Tower Road east to Schumaker Road, and from Jewell Avenue on the south to 72nd Avenue on the north. However, for this study DRCOG was used because it has a more recently updated 2050 projection for Airport Boulevard close to the proposed freezer facility.

The ADT's showed traffic volumes increasing by an average of 1.2% per year along Airport Boulevard. This annual growth rate was used to increase the background traffic volumes for the Buildout (2025) and Future (2050) analysis scenarios. The 1.2% annual growth leads to a growth factor of 1.012 for 2025 and 1.364 for 2050.

FIGURE 4
Site Trip Generation
and Distribution

IV. FUTURE CONDITIONS

IV.A. Buildout (2025) Traffic Conditions

Traffic Volumes

The 2025 Background peak hour traffic volumes were estimated using the existing peak hour traffic volumes grown by 1.2 percent. The background volumes for 2025 are shown on **Figure 5**. The site generated traffic volumes illustrated on **Figure 4** were added to the short-term background traffic volumes found on **Figure 5** to produce the total 2025 traffic volumes shown on **Figure 6**.

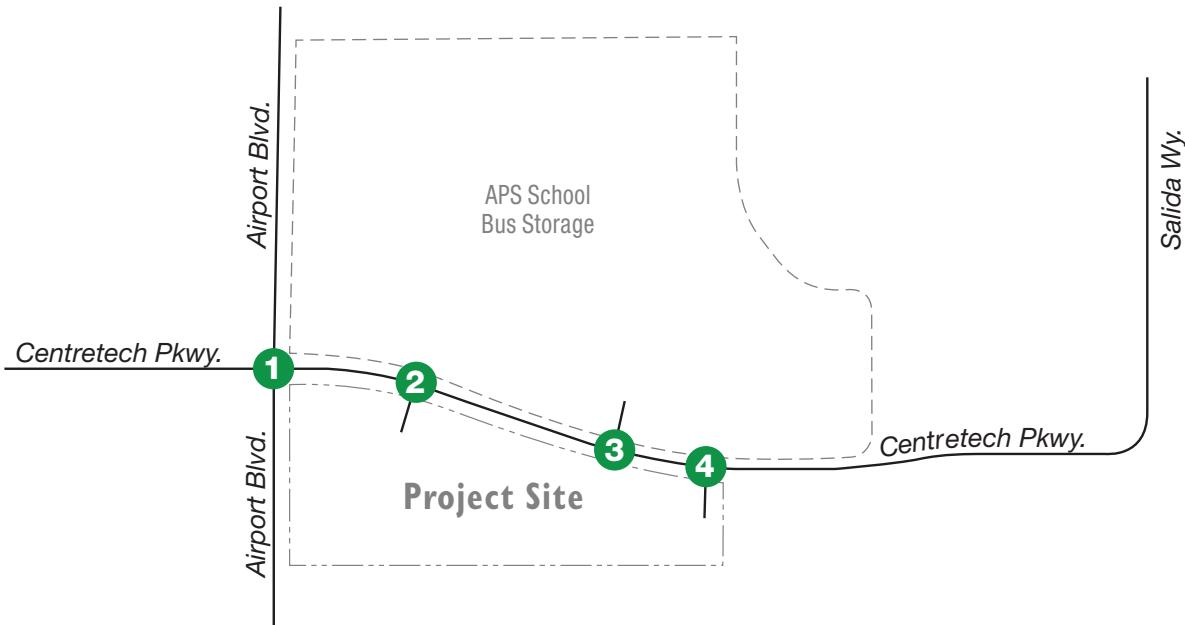

Traffic Control and Operations

The 2025 background LOS results and intersection lane configurations are included on **Figure 5**. The intersection of Airport Boulevard and Centretech Parkway will function at LOS A during the AM peak period and LOS B during the PM peak hour period. All unsignalized movements are expected to operate at LOS B or better for AM and PM peak hour periods. Calculations used techniques documented in the *Highway Capacity Manual* (Transportation Research Board, 2016) using anticipated traffic volumes and intersection geometry.

The 2025 Buildout LOS results and intersection lane configurations are included on **Figure 6**. The results are the same as the 2025 Background condition except for the northbound movements of the western site access during the AM peak period. This leg operates at LOS A in the background condition and LOS B in the total condition. Operation analysis worksheets are included in the **Appendix**.

It is recommended that an exclusive northbound right-turn lane be constructed at the intersection of Centretech Parkway and Airport Boulevard due to the high volume of movement during the AM peak hour. AM peak hour volumes are projected at 176 in the background and 192 during the total for the 2025 buildout scenarios. Although exclusive right-turn lanes are generally not required for approaches with three through lanes, the northbound right-turn volume is far above the 50-vehicle threshold stated in the CDOT State Highway Access Code (SHAC). Such a high turning volume has the potential to negatively impact operations and create adverse safety conditions when made from a shared lane.

- = Traffic Signal
- = Study Intersection

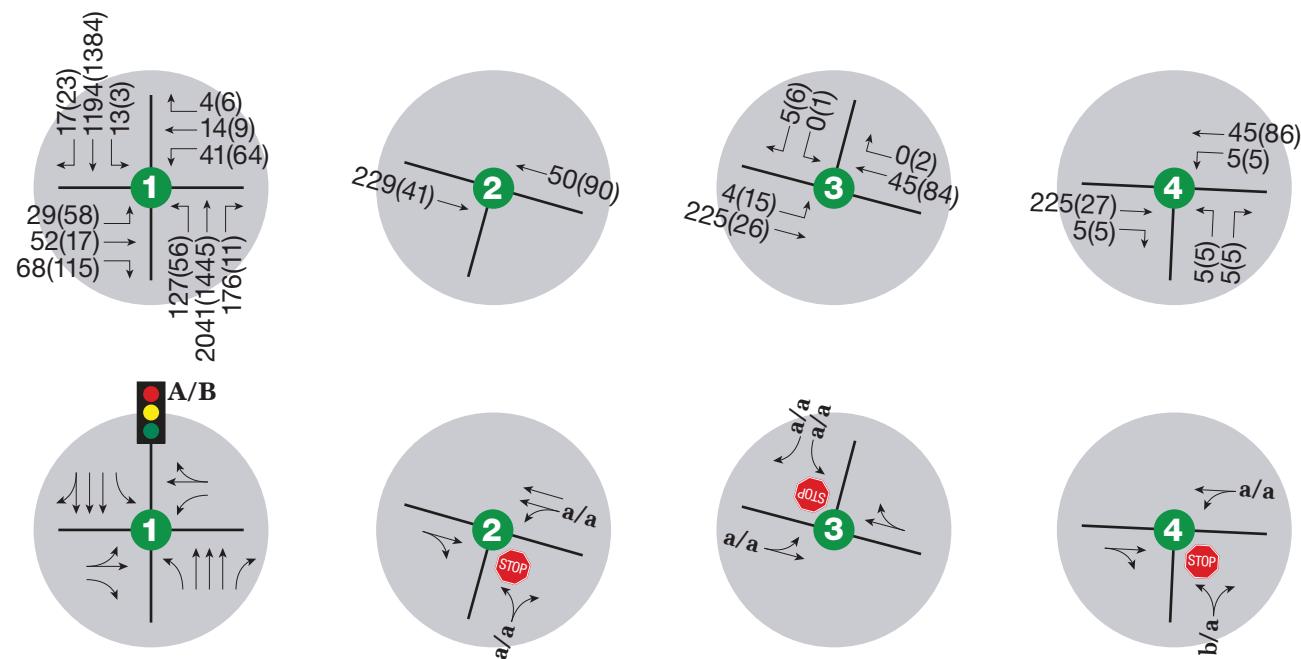

FIGURE 5
Buildout (2025) Background
Traffic Conditions

IV.B. Future (2050) Traffic Conditions

Traffic Volumes

The 2050 background traffic has been estimated using traffic volume projections from the DRCOG traffic demand model. A growth factor of 1.36 was applied to existing traffic volumes. **Figure 7** shows the projected long-term background traffic demands along the study area roadways and intersections.

The site generated traffic volumes illustrated on **Figure 4** were added to the long-term future background traffic volumes on **Figure 7** to produce the total 2050 traffic volumes shown on **Figure 8**.

Traffic Control and Operations

The background 2050 level of service (LOS) results and intersection lane configurations are included on **Figure 7**. Background traffic operates at LOS B or better during both AM and PM time periods at the intersection on Airport Blvd and Centretech Parkway as well as all stop-controlled movements on unsignalized intersections..

The 2050 total traffic LOS values are the same as 2050 background conditions except for the northbound movement at the western site access intersection during the AM peak period. That movement operates at LOS A in the background condition and LOS B in the total traffic condition. Operation analysis worksheets are included in the **Appendix**.

It is recommended that an exclusive northbound right-turn lane be constructed at the intersection of Centretech Parkway and Airport Boulevard due to the high volume of movement during the AM peak hour. AM peak hour volumes are projected at 237 in the background and 253 during the total for the 2050 future scenarios. Although exclusive right-turn lanes are generally not required for approaches with three through lanes, the northbound right-turn volume is far above the 50-vehicle threshold stated in the CDOT SHAC. Such a high turning volume has the potential to negatively impact operations and create adverse safety conditions when made from a shared lane.

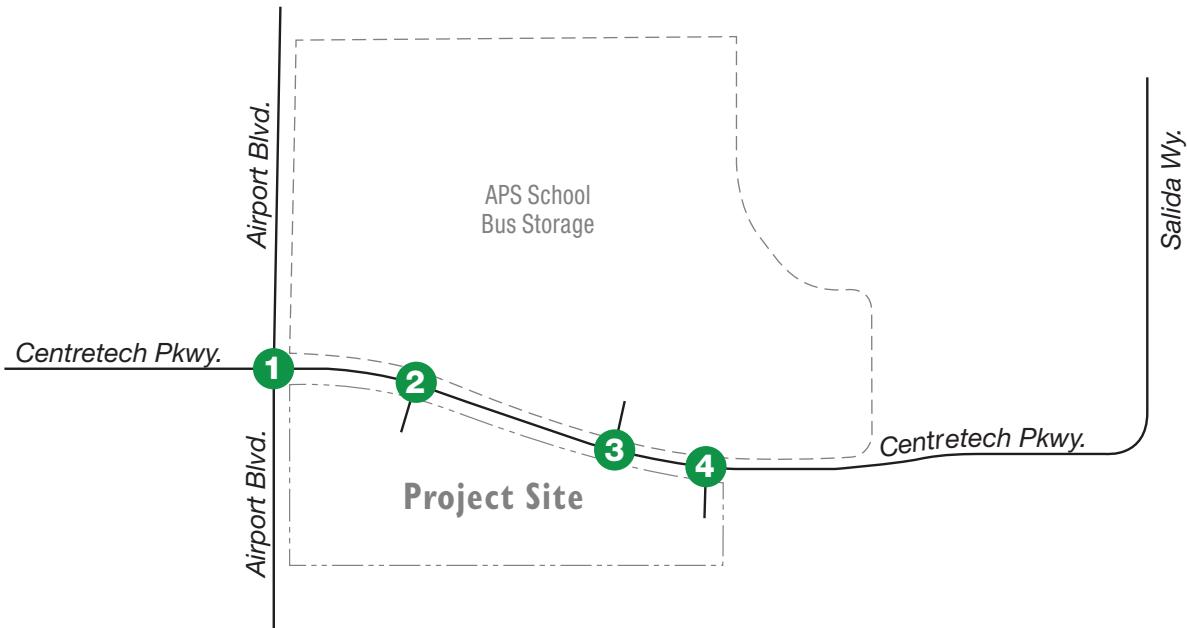

Queue Length Analysis

City of Aurora *Traffic Impact Study Guidelines* indicate that the *CDOT State Highway Access Code (SHAC)* be used to determine storage and taper lengths of auxiliary lanes. These values sometimes yield conservative results and provide storage well in excess of 95th percentile queues (which already incorporate a heavy vehicle percentage). Rather, the recommendation is that the values in **Table 5** corresponding to the 95th percentile lengths be used for storage lengths, plus a lead-in taper. It was assumed that Airport Boulevard is classified as NR-B Non-Rural Arterials. Table 4-8 in the *SHAC* was used to determine the recommended storage lengths. Existing turn bays are greater than the expected queue lengths for all movements.

Left turn lane storage lengths. At signalized intersections, the greater of the HCM 6th Edition or Synchro methodology queue calculations were reported. For unsignalized intersections, the HCM 6th Edition calculation was reported.

Through movements. For signalized intersections, Synchro calculation results were reported. No through movement queues are reported for unsignalized intersections as the through movements are free.

Right turn movements. The Synchro queue length was utilized for signalized intersections. HCM 6th Edition information was not used because HCM's signalized intersection methodology does not account for right turns on red. For unsignalized intersections, HCM 6th Edition calculation was reported.

V. SUMMARY AND RECOMMENDATIONS

Aurora Public Schools are proposing to develop an approximately 4.5-acre Freezer Facility. The proposed multifamily residential development would consist of 312 dwelling units. Access to the site will be provided along the north side of the site via Centretech Parkway.

The freezer facility site is in the southeast quadrant of the intersection of Airport Boulevard and Centretech Parkway. The development is estimated to generate 125 trips per day, with 30 vehicle-trips during the AM peak period and 33 vehicle-trips during the PM peak period when built out.

The potential traffic impacts of the development were evaluated under short-term Buildout (2025) and long-term Future (2050) conditions. Based on the results of the analysis, the key findings and recommendations of this study are listed.

- Intersections analyzed in this report will continue to operate at LOS B or better in 2050 with expected background growth and the addition of traffic from the Freezer facility.
- An exclusive Northbound right-turn lane is recommended at the intersection of Airport Boulevard Centretech Parkway. Although exclusive right-turn lanes are not generally required for approaches with three through lanes, the existing northbound right-turn AM volume is 174 and long term future projections are over 250, which is far above the 50-vehicle threshold stated in the SHAC. Such a high turning volume has the potential to negatively impact operations and create adverse safety conditions when made from a shared lane.
