Re: Horizon Uptown
Filing 9
Aurora, CO
LSC #250030

Dear Ms. Lee:

In response to your request, LSC Transportation Consultants, Inc. has prepared this site-specific traffic impact analysis for the proposed Horizon Uptown Filing 9 development. As shown on Figure 1, Horizon Uptown is located south of the I-70 Frontage Road, east of Picadilly Road, and north of Stephen D. Hogan Parkway in the City of Aurora, Colorado. The currently proposed Filing 9 is located west of the future Crossroads Boulevard between E. 6th Avenue and E. 10th Place.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected short-term and long-term background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements needed to mitigate the growth in background traffic or from the site's traffic impacts.

COMPARISON TO ASSUMPTIONS IN THE MASTER TRAFFIC STUDY

Matrix Design Group completed a Master Traffic Study (MTIS) for Horizon Uptown dated November 2, 2018 (Master TIA). In that study the master plan area was divided into 20 planning areas as shown in Figure 2. The Filing 9 site is within portions of Planning Areas 16, 17 and 18 as shown in Figure 2. Figure 2 also shows the location of the existing and/or approved Filings 1 through 6 as well as the existing recreation center and the location of a school site planned to be developed in the near term.

As shown in Appendix Table 1, there are currently 1,242 residential dwelling units within the Horizon Uptown development that are either existing, under construction, approved or currently under review. The MTIS assumed that about 1,477 residential dwelling units would be con-

structed in this same area. As this represents a significant reduction in density, the study area for the currently proposed Filing No. 9 only includes those intersections identified in the pre-application meeting held on August 24, 2023 that are either existing or planned to be constructed with the currently proposed Filing No. 9. Please refer to the MTIS for analysis of all intersections north of E. 10th Place.

LAND USE AND ACCESS

The Filing 9 site is proposed to include 136 residential dwelling units including a mix of single-family homes duplex dwelling units. Access is proposed from several locations as shown in the conceptual site plan in Figure 3.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **I-70 Frontage Road** is an east-west, two-lane frontage road north of the site. The intersections with Colfax Avenue and Picadilly Road are stop-sign controlled. The posted speed limit is 30 mph west of Picadilly Road and 45 mph east of Picadilly Road.
- **Picadilly Road** is a north-south, two-lane arterial roadway west of the site. The intersections with the I-70 Frontage Road and Stephen D. Hogan Parkway are stop-sign controlled. The posted speed limit is 45 mph in the vicinity of the site. It is planned to be a six-lane major arterial by 2040 per the *Aurora NEATS* study. The City of Aurora and CDOT are currently working towards constructing the I-70/Picadilly interchange.
- **Stephen D. Hogan Parkway** is an east-west, two-lane major arterial roadway south of the site. The intersection with Picadilly Road is stop-sign controlled. No speed limit is posted in the vicinity of the site. It is planned to be a six-lane major arterial by 2040 per the *Aurora NEATS* study.
- **Colfax Avenue** is an east-west, four-lane federal highway north of the site. The intersection with the Frontage Road is stop-sign controlled. The posted speed limit in the vicinity of the site is 55 mph.

Existing Traffic Conditions

Figure 4 shows the existing lane geometry, and traffic control at the intersection of Picadilly Road/E. 11th Avenue. Figure 4 also shows the existing daily traffic counts on Picadilly Road and Rome Street in the vicinity of the site based on the attached traffic counts conducted by Counter Measures in October, 2023 and February, 2024.

2026 and 2050 Background Traffic

Figure 5 shows the estimated 2026 background traffic. The 2026 background volumes are estimates by LSC based on the traffic projected to be generated with buildout of Horizon Uptown Filing Nos. 1 through 8 and about 60 percent of the traffic projected to be generated by Aurora

One at buildout taken from the recently approved *Aurora One TIS* by Fox and Tuttle Transportation Group, LLC. Key pages from the *Aurora One TIS* including the trip generation information are attached for reference. Figure 5 also shows the estimated 2026 background lane geometry and traffic control.

Figure 6 shows the estimated 2050 background traffic based on the buildout of the Horizon Uptown Master Plan (except for the currently proposed Filing No. 9), the Stafford Logistics Center, Aurora One, and the updated *Aurora NEATS* study. Figure 6 also shows the estimated 2050 background lane geometry and traffic control.

2026 and 2050 Background Levels of Service

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection. Level of service is indicated on a scale from "A" to "F". LOS "A" is indicative of little congestion or delay and LOS "F" is indicative of a high level of congestion or delay. Attached are specific level of service definitions for signalized and unsignalized intersections.

The intersections in Figures 5 and 6 were analyzed to determine the 2026 and 2040 background levels of service using Synchro Version 11. Table 1 shows the level of service analysis results. The level of service reports are attached.

2. **N. Ukraine Street/E. 10th Place:** All approaches at this future stop-controlled intersection are expected to operate at LOS "A" through 2050.
5. **N. Ukraine Street/E. 8th Avenue:** All approaches at this future stop-controlled intersection are expected to operate at LOS "B" or better through 2050.
7. **N. Ukraine Street/E. 7th Place:** All approaches at this future stop-controlled intersection are expected to operate at LOS "A" through 2050.
8. **Rome Street/E. 6th Avenue:** This intersection is currently two-way, stop-sign controlled with stop control on the eastbound and westbound approaches. Due to the poor alignment of the northbound through lane and the existing grade on the eastbound approach, LSC recommends that this intersection be converted to all-way stop-sign control. As an all-way stop-sign controlled intersection all movements are expected to operate at LOS "B" or better through 2050.
9. **N. Tempe Street/E. 6th Avenue:** All approaches at this future stop-controlled intersection are expected to operate at LOS "B" or better through 2050.
13. **N. Tempe Street/E. 7th Place:** All approaches at this stop-controlled intersection are expected to operate at LOS "A" through 2050.
14. **Crossroads Boulevard/E. 10th Place:** LSC recommends this intersection be restricted to three-quarter movement (left-in/right-in/right-out only) once Crossroads Boulevard is constructed to its final cross-section. Based on the 2050 background lane geometry, traffic control and volume shown on Figure 6 all movements at this intersection are expected to operate at LOS "B" or better through 2050.

15. **Crossroads Boulevard/E. 8th Avenue:** This intersection is expected to be traffic signal controlled by 2050. It is expected to operate at an overall LOS "B" during both peak-hours based on the 2050 background lane geometry, traffic control and volume shown on Figure 6.
16. **Crossroads Boulevard/E. 7th Place:** LSC recommends this intersection be restricted to three-quarter movement (left-in/right-in/right-out only) once Crossroads Boulevard is constructed to its final cross-section. Based on the 2050 background lane geometry, traffic control and volume shown on Figure 6 all movements at this intersection are expected to operate at LOS "B" or better through 2050.
17. **Crossroads Boulevard/E. 6th Avenue:** This intersection is expected to be traffic signal controlled by 2050. It is expected to operate at an overall LOS "B" during both peak-hours based on the 2050 background lane geometry, traffic control and volume shown on Figure 6.

TRIP GENERATION

Table 2 shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the proposed land use based on the rates from *Trip Generation*, 11th Edition, 2021 by the Institute of Transportation Engineers (ITE). Table 2 also shows the number of these trips that were assumed to travel to/from the Horizon Uptown PK-8 school just west of the site. About 50% of the Horizon Uptown PK-8 school-generated trips taken from the traffic impact analysis by LSC, dated October 29, 2024, were assumed to be to/from the residential areas within the overall Horizon Uptown development. The residential internal trips were then calculated by balancing the residential internal trips with the school internal trips based on the number of dwelling units in each Horizon Uptown planning area.

The proposed site is projected to generate about 1,121 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour which generally occurs for one hour between 6:30 and 8:30 a.m., about 20 vehicles would enter and about 60 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 62 vehicles would enter and about 39 vehicles would exit.

DIRECTIONAL DISTRIBUTION

Figure 7 shows the estimated directional distribution of the external residential site-generated traffic volumes on the area roadways. Traffic to and from the Horizon Uptown PK-8 school just west of the site was assigned separately based on the location of the planned school access points. The estimates were based on the location of the site with respect to the regional population, employment, and activity centers; and the site's proposed land use. The directional distribution estimate for Horizon Uptown was modified from what was shown in the approved Master traffic study for Horizon Uptown as part of a site-specific traffic study for Horizon Uptown Filing No. 3. This change was necessary based on the expanded study area of the Filing No. 3 study. The directional distribution estimate used in this Filing 9 report is consistent with the expanded distribution estimate assumed in the Filing No. 3 report. Key pages from that report have been attached for reference.

TRIP ASSIGNMENT

Figure 8 shows the estimated 2026 assignment of site-generated traffic volumes based on the trip generation estimate (from Table 2) and the 2026 directional distribution shown in Figure 7. The 2026 assignment assumed N. Tempe Street, N. Ukraine Street, and Crossroads Boulevard have only been constructed between E. 6th Avenue and E. 10th Place.

Figure 9 shows the estimated 2050 assignment of site-generated traffic volumes based on the trip generation estimate (from Table 2) and the 2050 directional distribution shown in Figure 7. The 2050 assignment assumes full buildout of the Horizon Uptown and Aurora One street networks.

2026 AND 2050 TOTAL TRAFFIC

Figure 10 shows the estimated 2026 total traffic which is the sum of the 2026 background traffic volumes (from Figure 5) and the 2026 site-generated traffic volumes (from Figure 8). Figure 10 also shows the recommended 2026 lane geometry and traffic control.

Figure 11 shows the estimated 2050 total traffic which is the sum of the 2040 background traffic volumes (from Figure 6) and the 2050 site-generated traffic volumes (from Figure 9). Figure 11 also shows the recommended 2050 lane geometry and traffic control.

TRAFFIC SIGNAL WARRANT ANALYSIS

The future intersections of Crossroads Boulevard/E. 8th Avenue (#15) and Crossroads Boulevard/E. 6th Avenue (#17) were analyzed to determine if the projected total traffic volumes would meet the thresholds criteria for Eight-Hour, Four-Hour, and Peak-Hour Vehicular Volume Traffic Signal Warrants in the *Manual on Uniform Traffic Control Devices* (MUTCD). The off-peak-hour volumes are estimates based on the hourly distribution of entering and exiting vehicle-trips published by the Institute of Transportation Engineers in 2021. The results of the signal warrant analysis are shown in Tables 3 and 4.

As shown in Table 3, by 2050 Crossroads Boulevard/E. 8th Avenue (#15) is expected to meet the Eight-Hour Vehicular Volume Traffic Signal Warrant, Four-Hour, and Peak-Hour Vehicular Volume Traffic Signal Warrants based on both the background and total traffic volumes.

As shown in Table 4, by 2050 Crossroads Boulevard/E. 6th Avenue (#17) is expected to meet the Four-Hour and Peak-Hour Vehicular Volume Traffic Signal Warrants based on both the background and total traffic volumes. This intersection is not projected to meet the Eight-Hour Vehicular Volume Traffic Signal Warrant based on the 2050 traffic volumes.

PROJECTED LEVELS OF SERVICE

The intersections in Figures 10 and 11 were analyzed to determine the 2026 and 2050 total levels of service. Table 1 shows the level of service analysis results. The level of service reports are attached.

2. **N. Ukraine Street/E. 10th Place:** All approaches at this future stop-controlled intersection are expected to operate at LOS "A" through 2050.

5. **N. Ukraine Street/E. 8th Avenue:** All approaches at this future stop-controlled intersection are expected to operate at LOS "B" or better through 2050.
7. **N. Ukraine Street/E. 7th Place:** All approaches at this future stop-controlled intersection are expected to operate at LOS "A" through 2050.
8. **Rome Street/E. 6th Avenue:** This intersection is currently two-way, stop-sign controlled with stop control on the eastbound and westbound approaches. Due to the poor alignment of the northbound through lane and the existing grade on the eastbound approach, LSC recommends that this intersection be converted to all-way stop-sign control. As an all-way stop-sign controlled intersection all movements are expected to operate at LOS "B" or better through 2050.
9. **N. Tempe Street/E. 6th Avenue:** All approaches at this future stop-controlled intersection are expected to operate at LOS "B" or better through 2050.
13. **N. Tempe Street/E. 7th Place:** All approaches at this stop-controlled intersection are expected to operate at LOS "A" through 2050.
14. **Crossroads Boulevard/E. 10th Place:** This intersection is expected to operate at LOS "A" for all movements in the short-term as a full-movement stop-sign controlled intersection. LSC recommends this intersection be restricted to three-quarter movement (left-in/right-in/right-out only) once Crossroads Boulevard is constructed to its final cross-section. Based on the 2050 total lane geometry, traffic control and volume shown on Figure 11 all movements at this intersection are expected to operate at LOS "B" or better through 2050.
15. **Crossroads Boulevard/E. 8th Avenue:** Only the west half of the ultimate Crossroads Boulevard cross-section is planned to be constructed as part of the currently proposed Horizon Uptown Filing 9. The intersection of Crossroads Boulevard/E. 8th Avenue is expected to operate at a satisfactory level of service as two-way stop-sign controlled intersection in the short-term based on the 2026 lane geometry and traffic volumes shown in Figure 10. By 2050 it was assumed Crossroads Boulevard would be built to its ultimate cross-section with two northbound and southbound through lanes and a raised center median. To maintain an acceptable level of service this intersection will likely need to be converted to traffic signal control by 2050. It is expected to operate at an overall LOS "B" during both peak-hours as signal controlled intersections based on the 2050 lane geometry and traffic volumes shown in Figure 11.
16. **Crossroads Boulevard/E. 7th Place:** This intersection is expected to operate at LOS "A" for all movements in the short-term as a full-movement stop-sign controlled intersection. LSC recommends this intersection be restricted to three-quarter movement (left-in/right-in/right-out only) once Crossroads Boulevard is constructed to its final cross-section. Based on the 2050 total lane geometry, traffic control and volume shown on Figure 11 all movements at this intersection are expected to operate at LOS "B" or better through 2050.
17. **Crossroads Boulevard/E. 6th Avenue:** Only the west half of the ultimate Crossroads Boulevard cross-section is planned to be constructed as part of the currently proposed Horizon Uptown Filing 9. The intersection of Crossroads Boulevard/E. 8th Avenue is expected to operate at a satisfactory level of service as two-way stop-sign controlled intersection

in the short-term based on the 2026 lane geometry and traffic volumes shown in Figure 10. By 2050 it was assumed Crossroads Boulevard would be built to its ultimate cross-section with two northbound and southbound through lanes and a raised center median. To maintain an acceptable level of service this intersection will likely need to be converted to traffic signal control by 2050. It is expected to operate at an overall LOS "B" during both peak-hours as a signal controlled intersection based on the 2050 lane geometry and traffic volumes shown in Figure 11.

95TH PERCENTILE QUEUE LENGTHS

The estimated 2050 95th percentile queue lengths for the study area intersections are shown in Table 5. Table 5 also shows the existing and recommended turn lane lengths based on the NR-B classification criteria in the CDOT *State Highway Access Code* and the projected 95th percentile queue lengths.

RECOMMENDED IMPROVEMENTS

Table 6 and Figures 10 and 11 show the recommended improvements. The recommended turn lane lengths are based on the criteria contained in the CDOT *State Highway Access Code* for the NR-B classification, the projected total traffic volumes shown in Figure 11, and the projected 95th percentile queue lengths shown in Table 5. A design speed of 35 mph was assumed for the collector roads within the study area.

CONCLUSIONS AND RECOMMENDATIONS

Trip Generation

1. Horizon Uptown Filing 9 is projected to generate about 1,121 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour about 20 vehicles would enter and about 60 vehicles would exit the site. During the afternoon peak-hour about 62 vehicles would enter and about 39 vehicles would exit.

Projected Levels of Service

2. Only the west half of the ultimate Crossroads Boulevard cross-section is planned to be constructed as part of the currently proposed Horizon Uptown Filing 9. The intersections of Crossroads Boulevard/E. 10th Place (#14), Crossroads Boulevard/E. 8th Avenue (#15), Crossroads Boulevard/E. 7th Place (#16), and Crossroads Boulevard/E. 6th Avenue (#17) are expected to operate at satisfactory levels of service as two-way stop-sign controlled intersections based on the 2026 lane geometry and traffic volumes shown in Figure 10. By 2050 it was assumed Crossroads Boulevard would be built to its ultimate cross-section with two northbound and southbound through lanes and a raised center median. To maintain an acceptable level of service, LSC recommends the intersections of Crossroads Boulevard/E. 10th Place (#14) and Crossroads Boulevard/E. 7th Place (#16) be restricted to three-quarter movement (left-in/right-in/right-out only) once Crossroads Boulevard is constructed to its final cross-section. The intersections of Crossroads Boulevard/E. 8th Avenue (#15) and Crossroads Boulevard/E. 6th Avenue (#17) will likely need to be conver-

ted to traffic signal control by 2050. Both intersections are expected to operate at an overall LOS "B" during both peak-hours as signal controlled intersections.

3. Due to the poor alignment of the northbound through lane and the existing grade on the eastbound approach LSC recommends that Intersection #8 (E. 6th Avenue/Rome Street) be converted to all-way stop-sign control. As an all-way stop-sign controlled intersection, all movements are expected to operate at LOS "B" or better through 2050.
4. All of the other study area intersections analyzed are expected to operate at acceptable levels of service through 2050 as stop controlled intersections.

Conclusions

5. The impact of the site can be accommodated by the existing and planned roadway network with the following recommended improvements.

Recommendations

6. The recommended improvements for 2026 and 2050 are shown in Figures 10 and 11 and are detailed in Tables 5 and 6.

* * * * *

We trust our findings will assist you in gaining approval of the proposed Horizon Uptown Filing 9 development. Please contact me if you have any questions or need further assistance.

Sincerely,

LSC TRANSPORTATION CONSULTANTS, INC.

Notes:

(1) Source: *Trip Generation*, 11th Edition, 2021 by the Institute of Transportation Engineers (ITE)

(2) ITE Land Use No. 215 - Single Family Attached Housing

(3) DU = Dwelling Unit

(4) ITE Land Use No. 210 - Single Family Detached Housing

(5) About 50% of the Horizon Uptown PK-8 school generated trips taken from the traffic impact analysis by LSC dated October 29, 2024 were assumed to be to/from the residential areas within the overall Horizon U development. The residential internal trips were then calculated by balancing the residential internal trips with the school internal trips based on the number

Warrant met?								5	8	6	6			3	6		
Warrant met?								Yes						Yes			

Notes:

- (1) Thresholds are based on 2 or more lanes on the major approach and 2 or more lanes on the minor approach with the 70% factor applied for a posted speed limit above 40 mph
 - (2) Off peak hour traffic volumes are estimates by LSC based on ITE Vehicle Time of Day Distribution Data
 - (3) The major street traffic includes all movements (left, through, and right)
 - (4) The minor street traffic includes left, through, and half of right-turn volumes from the minor street

- (1) The need for the eastbound and westbound auxiliary lanes at Crossroads Boulevard/E. 8th Avenue is based on the trip generation estimates for land uses east of Crossroads Boulevard shown in the *Horizon Uptown Master Traffic Study* by Matrix Design Group January 7, 2018. If the density in this area is reduced in a future master plan update these lanes may not be needed.

(1) A transition taper of 10:1 was used for all Collectors based on a posted speed limit of 35 mph (120 feet).

An appropriate redirect taper for 35 mph is 20:1

(2) The need for the eastbound and westbound auxiliary lanes at Crossroads Boulevard/E. 8th Avenue is based on the trip generation estimates for land uses east of Crossroads Boulevard shown in the Horizon Uptown Master Traffic Study by Matrix Design Group January 7, 2018. If the density in this area is reduced in a future master plan update these lanes may not be needed.

Greenwood Village, CO

Dear Mr. Margraf:

In response to your re-specific traffic impact analysis shown on Figure 1, the area south and north of Stephen D Hogan Parkway.

REPORT CONTENTS

The report contains the information for the site including the weekday peak-hour traffic and weekday site-generated

Master plan considers 340 DU for this planning area, less than proposed 203 DU. Remaining for this planning area = 137 DU.

Noted

The filing no. 3 site is duplex dwelling units. site plan in Figure 2.

ROADWAY AND TRAFFIC

Area Roadways

The major roadways in

Review Comments 2020-02-28

1) Traffic impact study assumptions should cite and agree with assumptions made in the 1/7/2018 Horizon Uptown Master Traffic Study.

The updated TIS includes an Appendix section that identifies some of the assumptions that were made. Changes to the directional distribution estimates were necessary based on the expanded study area of the traffic impact study.

2) Background 2021/2040 trips: specify which filings are included in these estimates and include approved trip generation totals for those filings.

The 2021 background traffic volumes shown in this report are based on the existing traffic volumes shown in Figure 3 with a 6.1 percent annual growth rate applied plus the traffic projected to be generated by Horizon Uptown Filing 1 and Stafford Logistics buildings 1 and 2.

The 2040 traffic volumes assume buildout of the Horizon Uptown Master Plan and Stafford Logistics. The updated TIA includes an appendix table summarizing the land uses assumed for the adjacent Aurora One parcel.

3) Background trips do not match TIAs from previously accepted filings.

The Horizon Uptown Filing 1 TIA and Stafford Logistics Center TIA were conducted prior to the opening of Stephen D Hogan Parkway. The short-term background traffic volumes were therefore based on projections shown in the 6th Avenue Extension TIS. Since completion of those reports Hogan Parkway has been completed. The short-term traffic volumes shown in this report are based on the existing traffic counts. Further differences in the short-term background trips are due to refinements in the projected trip generation and distribution of Horizon Uptown Filing 1 TIA.

4) Directional Distribution: Which model was used to derive distributions of future 2040 regional population/employment and activity centers?

The long-term assignment is for 2040 and assumes full buildout of the street network within the Horizon Master Plan area and the realignment of Picadilly Road in the vicinity of Colfax Avenue. Changes to the directional distribution estimates were necessary based on the expanded study area.

5) Clarify the intent of using different trip assignments for short- and long-term. What analysis years are implied?

The short-term assignment is for 2021 and assumes a limited street network within Horizon Uptown with only those street sections shown in Figure 2 assumed to be constructed. The short-term assignment also assumes the existing alignment of Picadilly Road and the frontage road in the vicinity of Colfax Road.

6) Address CDOT comments dated 2/16/2020

The updated study includes recommendations for interim improvements at #2 and #3.

7) Analyze 8th & Road A as a roundabout. Does it warrant an all-way stop condition?

The previous TIA assumed the proposed school would be a private school. The background trip generation estimates were revised in the update TIA to a public school. The reduction in trip generation and a change to the assumed site access points resulted in 8th/Road A operating at a satisfactory level of service as a TWSC intersection.

8) For signal timings, anticipate 120 sec minimum for 4-leg intersection. 90 sec for 3 leg minimum

The traffic signal timing plans have been updated as requested

Re: Horizon Uptown
Filing No. 3
Aurora, CO
LSC #191100

Dear Mr. Margraf:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated site-specific traffic impact analysis for the proposed Horizon Uptown Filing No. 3 development to address City comments. As shown on Figure 1, the site is located south of the I-70 Frontage Road, east of Picadilly Road, and north of Stephen D. Hogan Parkway in the City of Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected short-term and long-term background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements needed to mitigate the growth in background traffic or from the site's traffic impacts

COMPARISON TO ASSUMPTIONS IN THE MASTER TRAFFIC STUDY

Matrix Design Group completed a Master Traffic Study for Horizon Uptown dated November 2, 2018 (Master TIA). In that study the master plan area was divided into 20 planning areas as shown in Figure 2. The only change to the proposed land use at this time is the proposed school site north of Filing 3 was assumed as a private school in the Master TIA. The school is now proposed as a public school site so the overall trip generation potential for the overall site is now slightly lower.

Appendix Table 1 shows the land uses that are planned to be built out in the short-term (by 2025) by planning area. As shown in Appendix Table 2 this includes 392 dwelling units in the

NOTE: FOR INTERNAL INTERSECTIONS NOT ANALYZED IN THIS STUDY, ANTICIPATED VOLUMES ARE LOW AND SIDE-STREET STOP-CONTROL SHALL BE CONSIDERED ACCEPTABLE UNLESS STUDIED BY A LATER TRAFFIC IMPACT STUDY. ALL-WAY STOP-CONTROL SHALL NOT BE USED UNLESS AN ALL-WAY STOP WARRANT HAS BEEN MET PER CRITERIA SET FORTH IN THE MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES.

SIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

<u>LOS</u>	<u>Average Vehicle Delay</u> sec/vehicle	<u>Operational Characteristics</u>
A	<10 seconds	Describes operations with low control delay, up to 10 sec/veh. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	10 to 20 seconds	Describes operations with control delay greater than 10 seconds and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20 to 35 seconds	Describes operations with control delay greater than 20 and up to 35 sec/veh. These higher delays may result from only fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35 to 55 seconds	Describes operations with control delay greater than 35 and up to 55 sec/veh. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55 to 80 seconds	Describes operations with control delay greater than 55 and up to 80 sec/veh. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.
F	>80 seconds	Describes operations with control delay in excess of 80 sec/veh. This level, considered unacceptable to most drivers, often occurs with over-saturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual*, Transportation Research Board

UNSIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

Applicable to Two-Way Stop Control, All-Way Stop Control, and Roundabouts

LOS	Average Vehicle Control Delay	Operational Characteristics
A	<10 seconds	Normally, vehicles on the stop-controlled approach only have to wait up to 10 seconds before being able to clear the intersection. Left-turning vehicles on the uncontrolled street do not have to wait to make their turn.
B	10 to 15 seconds	Vehicles on the stop-controlled approach will experience delays before being able to clear the intersection. <u>The delay could be up to 15 seconds.</u> Left-turning vehicles on the uncontrolled street may have to wait to make their turn.
C	15 to 25 seconds	Vehicles on the stop-controlled approach can expect delays in the range of 15 to 25 seconds before clearing the intersection. Motorists may begin to take chances due to the long delays, thereby posing a safety risk to through traffic. <u>Left-turning vehicles on the uncontrolled street will now be required to wait to make their turn causing a queue to be created in the turn lane.</u>
D	25 to 35 seconds	This is the point at which a traffic signal may be warranted for this intersection. The delays for the stop-controlled intersection are not considered to be excessive. The length of the queue may begin to block other public and private access points.
E	35 to 50 seconds	The delays for all critical traffic movements are considered to be unacceptable. The length of the queues for the stop-controlled approaches as well as the left-turn movements are extremely long. <u>There is a high probability that this intersection will meet traffic signal warrants.</u> The ability to install a traffic signal is affected by the location of other existing traffic signals. Consideration may be given to restricting the accesses by eliminating the left-turn movements from and to the stop-controlled approach.
F	>50 seconds	The delay for the critical traffic movements are probably in excess of 100 seconds. The length of the queues are extremely long. Motorists are selecting alternative routes due to the long delays. <u>The only remedy for these long delays is installing a traffic signal or restricting the accesses.</u> The potential for accidents at this intersection are extremely high due to motorist taking more risky chances. If the median permits, motorists begin making two-stage left-turns.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
