Re:

Blackhawk, Solar Decathlon, Site Plan Amendment – Drainage Conformance Letter
Martin/Martin, Inc. Project No.: 19.0741

This Drainage Conformance letter accompanies the Site Plan Amendment of the project. The intent of this conformance letter is to confirm the grading changes due to modifications of the building footprint comply with the intent of the approved drainage design and remain in compliance with Aurora Water Storm Drainage Design and Technical Criteria, last revised August 2024.

The Solar Decathlon development is a 0.62 acre site located in Aurora, Colorado, and is located within the southwest quarter of Section 31, Township 3 South, Range 66 West of the Sixth Principal Meridian. The project is bound by single-family dwellings to the north, east and west, and by a multi-family dwelling to the south.

Pre-development conditions consist of being vacant land with sparse vegetation and trees. Proposed conditions from the approved Site Plan includes placement of four prefabricated single-family homes. Foundations will be installed on site for each home. Water and sewer mains will be extended from Blackhawk Street into the site, and each house will be provided with service taps. Additionally, the project will include a shared 9-stall asphalt parking lot and landscaping. Per the project's Final Drainage Report dated August 24, 2020, the proposed development results in composite imperviousness of 66.3%. This includes runoff from the property to the south. The 10-year is 4.12 cfs while the 100-year is 6.92 cfs.

A recent Site Plan Amendment in process reduces decks for Houses A and B along with limited sidewalk expansion, and a new floor plan for House D. While drainage routing will remain unchanged, the stated amendments result in a composite imperviousness of 68.2%. The 10-year is 4.13 cfs while the 100-year is 6.96 cfs. Specifically, Basins A1, A3, B1 and D1 have been affected by the Amendment changes.

The project's Amendment to grading and drainage design will match the outfall locations and general drainage patterns of the previously approved Site Plan. The Amendment imperviousness has increased 3% while the 10 and 100-year events increased by 1% each. The increases are limited in nature and are not anticipated to affect the previously approved stormwater infrastructure systems based on updated calculations, therefore, the project's Amendment to grading and drainage conforms to the design requirements set forth in the Final Drainage Report.

Sincerely,

Mark Thornbrough, PE
Principal

* Actual release rates account for undetained basins: peak runoff from basins C1 & C2 are subtracted from Detention A release rate, and peak runoff from C3 is subtracted from Detention B release rate.

6.33 Volume and Release Rates

a) When the detention facility discharges into an existing storm sewer, street, or improved drainageway, the minimum detention volume shall be determined using the following equation (see Paragraph c) for additional limitations):

$$V = KA$$

For the 100-year, $K_{100} = (1.781 - 0.002I^2 - 3.56)/900$ (6.1)
 For the 10-year, $K_{10} = (0.951 - 1.90)/1000$ (6.2)
 Where V = required volume for the 100- or 10-year storm (acre-feet)

I = Developed basin imperviousness (%)
 A = Tributary area (acres)

The maximum release rates at the ponding depths corresponding to the 10- and 100-year volumes are as follows:

Allowable release rates for detention ponds - CFS/ACRE

Storm Frequency	SCS Hydrologic Soil Group		
	A	B	C&D
10-year	0.13	0.23	0.30
100-year	0.50	0.85	1.00

The predominant soil group for the total basin area tributary to the detention pond shall be used for determining the allowable release rate.

City of Aurora Storm Drainage Design and Technical Criteria, October 2010

3.0 Calculation of the WQCV

The WQCV is calculated as a function of imperviousness and BMP type using Equation 3-1 and Table 3-2, and as shown in Figure 3-1:

$$WQCV = a(0.91I^3 - 1.19I^2 + 0.78I) \quad \text{Equation 3-1}$$

Where:

WQCV = Water Quality Capture Volume (watershed-inches)

a = Coefficient corresponding to BMP type and based on WQCV design drain time (Table 3-2)

I = Imperviousness (percent expressed as a decimal) Note: At a planning level, the watershed imperviousness can be estimated based on the zoned density. When finalizing design, calculate imperviousness based on the site plan.

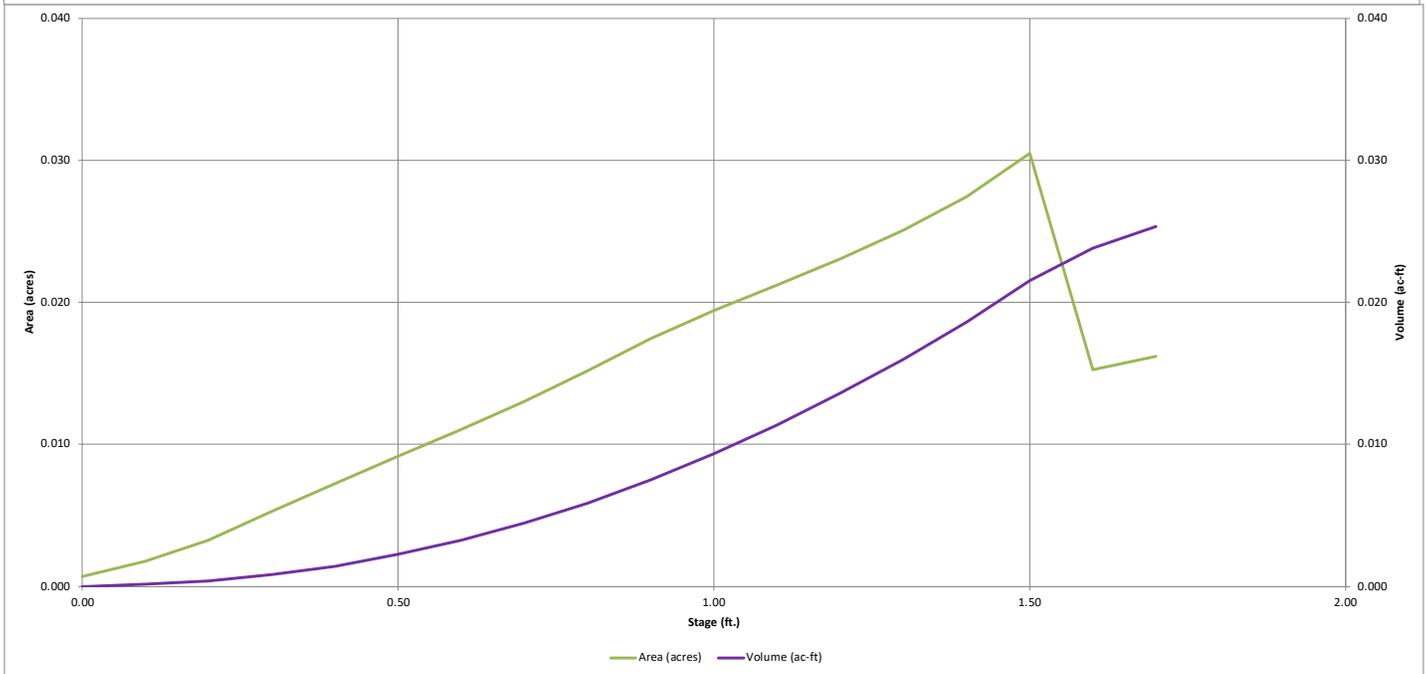

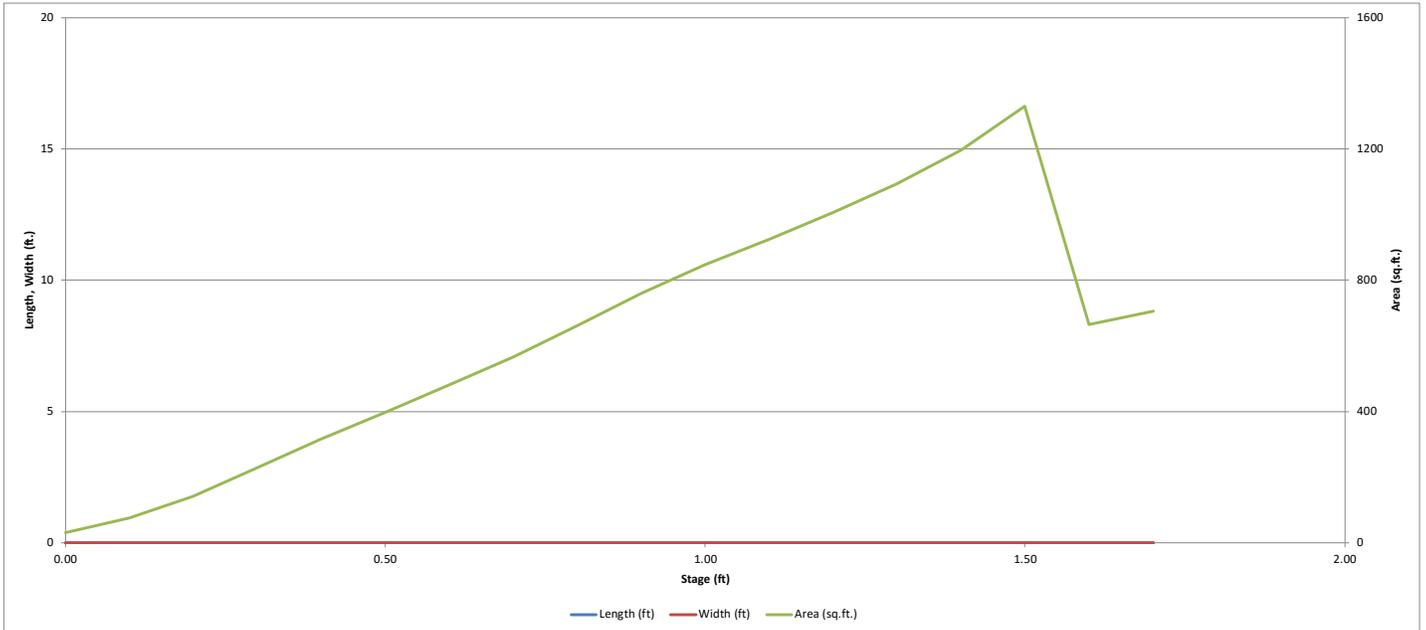

Table 3-2. Drain Time Coefficients for WQCV Calculations

Drain Time (hours)	Coefficient, a
12 hours (filtration BMPs and retention ponds)	0.8
24 hours (constructed wetland ponds)	0.9
40 hours (extended detention)	1.0
No attenuation (e.g., grass buffer or swale)	1.0
