Re: Harmony Phase 6
Aurora, CO
LSC #220300

Dear Mr. Spehalski:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed Harmony Phase 6 development to address City comments. As shown on Figure 1, the site is located south of E. 6th Avenue and east of S. Powhaton Road in eastern Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected 2024 and 2040 background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements to mitigate the site's traffic impacts.

RECENT TRAFFIC STUDIES

LSC prepared an updated master traffic impact study (MTIS) for the entire Harmony Master Plan, dated March 31, 2023.

LSC has also prepared site-specific traffic reports for the ASP Harmony Ridge P-8 School, dated October 12, 2018, Harmony Phase 3, dated November 4, 2020, Harmony Phase 4, dated July 16, 2021, Harmony Phase 5, dated August 25, 2022 and Harmony Phase 9 dated August 5, 2022.

LAND USE AND ACCESS

The site is proposed to include 663 residential dwelling units including a mix of single-family detached and attached dwelling units. Three full-movement access points are proposed to Trussville Street. A three-quarter movement (left-in/right-in/right-out-only) and a right-in/

right-out-only access are proposed to Powhaton Road. A three-quarter access is proposed to E. 6th Avenue. The proposed site plan is shown in Figure 2.

The currently proposed Phase 6 development was included in the Updated MTIS as Planning Areas 86, 87, 88, and 89. The currently proposed land use and access are consistent with the update currently being made to the MTIS.

VEHICLE AND PEDESTRIAN CONNECTIVITY

Figure 2 shows all of the proposed sidewalks and trails within the proposed Harmony Phase 6. As shown in Figure 2, the proposed pedestrian system provides for access between the residential land uses and the existing Harmony Ridge P-8 School.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **S. Powhaton Road** is a north-south roadway west of the site. The posted speed limit is 45 mph in the vicinity of the site. S. Powhaton Road currently has two southbound through lanes from E. 6th Avenue to just south of E. Alameda Avenue and two northbound through lanes from just south of Alameda Avenue to just north of E. 1st Avenue/E. Ellsworth Avenue. A second northbound through lane will be added from just north of E. 1st Avenue/E. Ellsworth Avenue to E. 6th Avenue adjacent to the site with the currently proposed Harmony Phase 6.
- **Trussville Street** is north-south, two-lane collector roadway that currently extends from E. Alameda Avenue to E. 1st Avenue. Trussville Street will be extended south to E. Mississippi Avenue as part of Harmony Phases 4 and 5. Trussville Street will be extended north to E. 6th Avenue as part of the currently proposed Harmony Phase 6.
- **E. 6th Avenue:** The E. 6th Avenue alignment forms the north boundary of the Harmony Phase 6 development. The NEATS study shows the section adjacent to the site as a six-lane Major Arterial. A half section of E. 6th Avenue is planned to be constructed between Powhaton Road and Trussville Street as part of the currently proposed Harmony Phase 6.
- **E. Ellsworth Avenue** is a two-lane collector roadway that extends east from the intersection of 1st Avenue and S. Powhaton Road through the Harmony Master Plan area. E. Ellsworth Avenue is planned to be extended east to Monaghan Road as part of the Harmony development and further east to serve the Sky Ranch development.

Existing Traffic Conditions

Figure 3 shows the existing traffic volumes, lane geometries, and traffic controls in the site's vicinity on a typical weekday. The weekday peak hour traffic volumes and the daily traffic volumes are based on the attached traffic counts conducted by Counter Measures in March, 2022 and June, 2022, respectively.

Note that the traffic counts were conducted prior to the recent widening project of S. Powhaton Road in the vicinity of the site which included the extension of E. 1st Avenue to S. Powhaton Road.

2024 and 2040 Background Traffic

Figure 4a shows the estimated 2024 background traffic volumes and Figure 4b shows the 2024 background lane geometry and traffic control for the study area intersections. The 2024 background traffic volumes are based on a two percent annual growth rate for through traffic on S. Powhaton Road plus estimates of additional traffic projected to be generated with the extension of E. 1st Avenue to S. Powhaton Road, by buildout of Harmony Phases 1 through 5, and by buildout of Phase 1 of the Sky Ranch development located south of I-70 between S. Powhaton Road and Hayesmount Road. The 2024 background traffic volumes assume E. 6th Avenue has not been constructed east of Trussville Road and Monaghan Road has not been constructed north of E. Ellsworth Avenue.

Figure 5a shows the estimated 2040 background traffic volumes and Figure 5b shows the 2040 background lane geometry and traffic control for the study area. The 2040 background traffic volumes include trips estimated to be generated by build out of the future land uses within the Harmony Master Plan area except for those land uses within the currently proposed Phase 6. The 2040 background traffic volumes are based on 2040 total volumes shown in the recently updated Harmony MTIS.

Existing, 2024, and 2040 Background Levels of Service

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection. Level of service is indicated on a scale from "A" to "F." LOS A is indicative of little congestion or delay and LOS F is indicative of a high level of congestion or delay. Attached are specific level of service definitions for signalized and unsignalized intersections.

The intersections in Figures 3 through 5b were analyzed to determine the existing, 2024, and 2040 background levels of service using Synchro. Table 1 shows the level of service analysis results. The level of service reports are attached.

- 1. S. Powhaton Road/E. 6th Avenue:** All movements at this unsignalized intersection currently operate at LOS "B" or better during both morning and afternoon peak-hours. By 2024 the eastbound left-turn movement is projected to operate at LOS "F" during the morning and afternoon peak-hours if it remains stop-sign controlled. It is expected to operate at an overall LOS "D" during the peak hours through 2040 as a traffic signal controlled intersection.
- 2. E. 6th Avenue/N. Robertsdale Street:** This intersection was analyzed only in the total traffic scenarios.
- 3. E. 6th Avenue/Trussville Street:** This future signalized intersection was only analyzed for the 2040 background traffic scenario. It is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.

7. **S. Powhaton Road/E. 3rd Avenue:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both peak-hours through 2040 assuming it is restricted to a three-quarter movement intersection (left-in/right-in/right-out only).
9. **S. Powhaton Road/E. 1st Avenue/Ellsworth Avenue:** All movements at this unsignalized intersection currently operate at LOS "B" or better during both morning and afternoon peak-hours. The eastbound and westbound approaches are expected to operate at LOS "F" during the peak-hours by 2024 if this intersection remains stop-sign controlled. By 2040 it was assumed that this intersection would be converted to traffic signal control. It is expected to operate at an overall LOS "B" during both morning and afternoon peak-hours through 2040.
10. **Trussville Street/E. Ellsworth Avenue:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.
33. **S. Powhaton Road/E. 4th Avenue:** This intersection was analyzed only in the total traffic scenarios.
34. **Trussville Street/E. 4th Place:** This intersection was analyzed only in the total traffic scenarios.
35. **Trussville Street/E. 3rd Avenue:** All movements at this stop-sign controlled intersection are expected to operate at LOS "A" through 2040.
37. **Trussville Street/E. 2nd Place:** All movements at this stop-sign controlled intersection are expected to operate at LOS "A" through 2040.
38. **N. Robertsdale/E. Ellsworth Avenue:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.

TRIP GENERATION

Table 2 shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the proposed land use based on the rates from *Trip Generation, 11th Edition, 2021* by the Institute of Transportation Engineers (ITE).

The site is expected to generate about 5,473 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 108 vehicles would enter and about 286 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 316 vehicles would enter and about 197 vehicles would exit.

DIRECTIONAL DISTRIBUTION

Figure 6 shows the estimated short-term and long-term directional distribution of site-generated traffic volumes on the area roadways. The estimates were based on the location of the site with respect to the regional population, employment, and activity centers; and the site's proposed land use. The short-term directional distribution estimate assumes E. 6th Avenue has not been constructed east of Trussville Road and Monaghan Road has not been constructed north of E. Ellsworth Avenue.

TRIP ASSIGNMENT

Figures 7 and 8 show the estimated assignment of 2024 and 2040 site-generated traffic volumes, respectively. The site-generated traffic volumes are based on the external trip generation estimate (from Table 2) and the directional distribution shown in Figure 6. Internal trips between the proposed Harmony Phase 6 residential and the non-residential land uses within the overall Harmony Master Plan have been assigned separately based on the location of the school sites, community center, and future commercial areas. As shown in the Harmony MTIS about seven percent of the daily residential vehicle trips are expected to remain internal to the overall Harmony Master Plan area.

2024 AND 2040 TOTAL TRAFFIC

Figure 9a shows the estimated 2024 total traffic volumes for the study area intersections. These volumes are the sum of the 2024 background traffic volumes (from Figure 4a) and the 2024 site-generated traffic volumes (from Figure 7). Figure 9b shows the recommended 2024 lane geometry and traffic control for the study area intersections.

Figure 10a shows the estimated 2040 total traffic volumes for the study area intersections. These volumes are the sum of the 2040 background traffic volumes (from Figure 5a) and the 2040 site-generated traffic volumes (from Figure 8). Figure 10b shows the recommended 2040 lane geometry and traffic control for the study area intersections.

PROJECTED LEVELS OF SERVICE

The intersections in Figures 9a through 10b were analyzed to determine the 2024 and 2040 total levels of service. Table 1 level of service analysis results. The level of service reports are attached.

1. **S. Powhaton Road/E. 6th Avenue:** This signalized intersection is expected to operate at an overall LOS "B" during the morning peak-hour and LOS "D" during the afternoon peak-hour through 2024. By 2040 both peak-hours are expected to operate at an overall LOS "D" during both peak-hours.
2. **E. 6th Avenue/N. Robertsdale Street:** All movements at this stop-sign controlled intersection are expected to operate at LOS "B" or better during both morning and afternoon peak-hours through 2040.

3. **E. 6th Avenue/Trussville Street:** This future signalized intersection was only analyzed for the 2040 total traffic scenario. It is expected to operate at an overall LOS "B" during the morning peak-hour and LOS "A" during the afternoon peak-hour through 2040.
7. **S. Powhaton Road/E. 3rd Avenue:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040 assuming it is restricted to a three-quarter movement intersection (left-in/right-in/right-out only).
9. **S. Powhaton Road/E. 1st Avenue/Ellsworth Avenue:** This intersection is expected to be signalized by 2024 and operate at an overall LOS "B" during both morning and afternoon peak-hours through 2024 and LOS "C" or better through 2040.
10. **E. 6th Avenue/E. Ellsworth Avenue:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.
33. **S. Powhaton Road/E. 4th Avenue:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.
34. **Trussville Street/E. 4th Place:** All movements at this stop-sign controlled intersection are expected to operate at LOS "A" during both morning and afternoon peak-hours through 2040.
35. **Trussville Street/E. 3rd Avenue:** All movements at this stop-sign controlled intersection are expected to operate at "B" or better during both morning and afternoon peak-hours through 2040.
37. **Trussville Street/E. 2nd Place:** All movements at this stop-sign controlled intersection are expected to operate at "B" or better both morning and afternoon peak-hours through 2040.
38. **N. Robertsdale/E. Ellsworth Avenue:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.

95TH PERCENTILE QUEUE LENGTHS AND RECOMMENDED TURN LANES

The estimated 2040 95th percentile queue lengths for the intersections in the study area are shown in Table 3. Table 3 also shows the recommended turn lane lengths based on the NR-B classification criteria in the *CDOT State Highway Access Code* and the projected 95th percentile queue lengths. The recommended turn lane lengths are rounded up to the nearest 25 feet per feedback from City staff.

The westbound queue on E. Ellsworth Avenue approaching S. Powhaton Road may block the first intersection to the east (N. Quantock Street) in the long-term. If this occurs regularly, the existing on-street parking may need to be removed to add eastbound and westbound left-turn lanes.

TRAFFIC SIGNAL WARRANT ANALYSIS

Tables 4 through 6 show the projected traffic volumes compared to the traffic volume thresholds for Traffic Signal Warrant 1 (Eight-Hour), Warrant 2 (Four-Hour), and Warrant 3 (Peak-Hour) from the 2009 *Manual on Uniform Traffic Control Devices for Street and Highway* (MUTCD) at the following intersections:

- S. Powhaton Road/E. 6th Avenue (#1) - Table 4
- E. 6th Avenue/Trussville Street (#3) - Table 5
- S. Powhaton Road/E. 1st Avenue/E. Ellsworth Avenue (#9) - Table 6

The off-peak traffic volumes were based on the peak-hour volumes and 24-hour traffic counts conducted on S. Powhaton Road south of E. Alameda Avenue by Counter Measures in March, 2022.

The findings of Tables 4 through 6 are summarized in Table 7. As shown in Table 6, the intersections of S. Powhaton Road/E. 6th Avenue (#1) and S. Powhaton Road/E. 1st Avenue/ Ellsworth Avenue (#9) are expected to meet multiple traffic signal warrants based on the projected 2024 **background** traffic volumes. The intersection of E. 6th Avenue/Trussville Street (#3) will not likely meet traffic signal warrants until E. 6th Avenue is constructed east of Trussville Street. As shown in Table 6 it is projected to meet multiple traffic signal warrants based on the projected 2040 **background** traffic volumes.

RECOMMENDED IMPROVEMENTS

Table 8 shows the recommended improvements by 2024 and 2040. The recommended turn lane lengths are based on the criteria contained in the *CDOT State Highway Access Code* for the NR-B classification, the projected total traffic volumes shown in Figures 9a and 10a, and the projected 95th percentile queue lengths shown in Table 3. A design speed of 45 mph was assumed for all Major and Minor Arterial roadways, a design speed of 35 mph was assumed for Collector roadways, and a design speed of 25 mph was assumed for all Local roadways. The recommended turn lane lengths are rounded up to the nearest 25 feet per feedback from City staff.

CONCLUSIONS AND RECOMMENDATIONS

Trip Generation

1. The site is expected to generate about 5,473 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 108 vehicles would enter and about 286 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 316 vehicles would enter and about 197 vehicles would exit.

Projected Levels of Service

2. All of the signalized, stop-sign controlled and roundabout controlled intersections in the study area are expected to operate at LOS "D" or better during both morning and afternoon peak-hours through 2040 with the recommended improvements.

Conclusions

3. The impact of the site can be accommodated by the existing and planned roadway network with the following recommended improvements.

Recommendations

4. The recommended improvements for 2024 and 2040 are shown in Figures 9b and 10b and detailed in Tables 3 and 8.

Notes:

- (1) Auxiliary turn lane lengths on arterial roadways are based on 45 mph and the NR-B classification in the CDOT State Highway Access Code and the 95th percentile queue length.
 Collectors are based on 35 mph and Local Street on 25 mph
 A redirect taper of 45:1 is appropriate for 45 mph and 20:1 for 35 mph.
 The lengths shown are consistent with the Recommended Improvements shown in Table 8.
- (2) If the westbound queue on E. Ellsworth Avenue regularly blocks the first intersection to the east (N. Quantock Street) the existing on-street parking may need to be removed to add eastbound and westbound left-turn lanes

		Traffic signalization when warranted	Applicant/Others						

(1) A transition taper of 13.5:1 was used for Major and Minor Arterials based on a posted speed limit of 45 mph (160 feet).

Dual left-turn lanes have transition taper lengths of 325 feet. An appropriate redirect taper for 45 mph is 45:1

A transition taper of 10:1 was used for all Collectors based on a posted speed limit of 35 mph (120 feet). An appropriate redirect taper for 35 mph is 20:1.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

SIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

<u>LOS</u>	<u>Average Vehicle Delay</u> sec/vehicle	<u>Operational Characteristics</u>
A	<10 seconds	Describes operations with low control delay, up to 10 sec/veh. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	10 to 20 seconds	Describes operations with control delay greater than 10 seconds and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20 to 35 seconds	Describes operations with control delay greater than 20 and up to 35 sec/veh. These higher delays may result from only fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35 to 55 seconds	Describes operations with control delay greater than 35 and up to 55 sec/veh. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55 to 80 seconds	Describes operations with control delay greater than 55 and up to 80 sec/veh. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.
F	>80 seconds	Describes operations with control delay in excess of 80 sec/veh. This level, considered unacceptable to most drivers, often occurs with over-saturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

UNSIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

Applicable to Two-Way Stop Control, All-Way Stop Control, and Roundabouts

LOS	Average Vehicle Control Delay	Operational Characteristics
A	<10 seconds	Normally, vehicles on the stop-controlled approach only have to wait up to 10 seconds before being able to clear the intersection. Left-turning vehicles on the uncontrolled street do not have to wait to make their turn.
B	10 to 15 seconds	Vehicles on the stop-controlled approach will experience delays before being able to clear the intersection. The delay could be up to 15 seconds. Left-turning vehicles on the uncontrolled street may have to wait to make their turn.
C	15 to 25 seconds	Vehicles on the stop-controlled approach can expect delays in the range of 15 to 25 seconds before clearing the intersection. Motorists may begin to take chances due to the long delays, thereby posing a safety risk to through traffic. Left-turning vehicles on the uncontrolled street will now be required to wait to make their turn causing a queue to be created in the turn lane.
D	25 to 35 seconds	This is the point at which a traffic signal may be warranted for this intersection. The delays for the stop-controlled intersection are not considered to be excessive. The length of the queue may begin to block other public and private access points.
E	35 to 50 seconds	The delays for all critical traffic movements are considered to be unacceptable. The length of the queues for the stop-controlled approaches as well as the left-turn movements are extremely long. There is a high probability that this intersection will meet traffic signal warrants. The ability to install a traffic signal is affected by the location of other existing traffic signals. Consideration may be given to restricting the accesses by eliminating the left-turn movements from and to the stop-controlled approach.
F	>50 seconds	The delay for the critical traffic movements are probably in excess of 100 seconds. The length of the queues are extremely long. Motorists are selecting alternative routes due to the long delays. The only remedy for these long delays is installing a traffic signal or restricting the accesses. The potential for accidents at this intersection are extremely high due to motorist taking more risky chances. If the median permits, motorists begin making two-stage left-turns.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
