1900 S CHAMBERS ROAD TRAFFIC IMPACT STUDY

1.0 Introduction

The Fox Tuttle Transportation Group has prepared this traffic impact study for the development of the 1900 S Chambers Road project. The 8± acres of vacant property are located in the City of Aurora east of Chambers Road, between Mexico Avenue and Evans Avenue. It is understood that the development will construct 60 attached single-resident dwelling units of affordable housing (30% adjusted median income) as well as approximately 995 square feet of office space for non-profit mental health providers. Access to the site is planned to be located on Chambers Road at one (1) location. Adjacent land uses are comprised of residential, commercial, and a self-storage business directly north of the project site. **Figure 1** provides a vicinity map for the proposed project.

The purpose of this study is to assist in identifying potential traffic impacts within the study area as a result of this project. The traffic study addresses existing, short-term, and long-term peak hour intersection conditions in the study area with and without the project-generated traffic. The information contained in this study is anticipated to be used by the City of Aurora staff in identifying any intersection or roadway deficiencies and potential improvements for the build-out condition and long-term future scenarios. This study focused on the weekday AM and PM peak hours which represent the periods of highest trip generation for the proposed use and adjacent street traffic. The study is consistent with the requirements of the City of Aurora's *Traffic Impact Study Guidelines* (June 2015).

2.0 Project Description

The 1900 S Chambers Road project plans to develop vacant land with 60 attached single-resident affordable housing dwelling units for residents meeting a 30% adjusted median income requirement, as well as approximately 995 square feet of office space for non-profit mental health providers. The project proposes to construct one (1) access on Chambers Road. The access is proposed to be right-in, right-out and side-street stop-controlled. For the purpose of this traffic study, it was assumed that the project will be built out and occupied by Year 2027. **Figure 2** shows the site plan and proposed access location.

3.0 Study Considerations

3.1 Data Collection

Intersection turning movement volumes were collected in February 2024 at two (2) existing intersections during the weekday AM and PM peak hours, including pedestrians and bicyclists. Daily traffic volumes were also collected on Chambers Road north of the proposed access (south of the existing self-storage access) for 24 hours.

From the collected traffic data, no bicyclists were present at either study intersection during the AM or PM peak hours. Pedestrian movement at each intersection varied between zero (0) and five (5) pedestrians crossing the street per approach. Total pedestrian crossing volume ranged from six (6) to twelve (12) per intersection during the peak hour.

Heavy vehicle percentages were collected at the study intersections by intersection approach and peak hour. Heavy vehicle percentages ranged from zero (0) percent to 2.3%. For conservative purposes, the minimum heavy vehicle percentage used in the analysis was 1% for approaches with less than 1% heavy vehicles.

The existing traffic volumes and intersection peak hours are illustrated on **Figure 3**. The existing intersection geometry and traffic control are also shown on this figure. Count data sheets are provided in the **Appendix**.

3.2 Evaluation Methodology

The traffic operations analysis addressed the signalized and unsignalized intersection operations using the procedures and methodologies set forth by the *Highway Capacity Manual (HCM)*¹. Existing peak hour factors (PHF) by approach and peak hour were applied to the study intersections for the existing scenarios. For long-term future scenarios, the PHF were set to 0.92 unless the existing PHF was greater than these values, with the exception of the westbound approach of Chambers Road and Mexico Avenue in the AM peak hour. At this intersection, the existing AM PHF was maintained for all scenarios given that the AM PHF is likely heavily influenced by the school to the west. Study intersections were evaluated using Synchro software (v12).

¹ [Highway Capacity Manual](#), Highway Research Board Special Report 209, Transportation Research Board, National Research Council, 7th Edition (2022).

The PHF is a ratio which describes how evenly distributed traffic during the peak hour arrives at the intersection. A PHF near 0.25 would indicate that most of the peak hour traffic arrives at the intersection at the same time, while a PHF closer to 1.0 would indicate that the peak hour traffic's arrival at the intersection is evenly distributed over the hour.

3.3 Level of Service Capacity Analysis

A Level of Service analysis was conducted to determine the existing and future performance of the study area intersections and accesses to determine the most appropriate intersection traffic controls and auxiliary lanes for future conditions.

To measure and describe the operational status of the study intersections, transportation engineers and planners commonly use a system referred to as "Level of Service" (LOS) that is defined by the *HCM*. LOS characterizes the operational conditions of an intersection's traffic flow, ranging from LOS A (indicating free flow operations) and LOS F (indicating congested and sometimes oversaturated conditions). These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with traveling through the intersections. The intersection LOS is based on delay in seconds per vehicle for the intersection as a whole and for each movement.

Typically, LOS D overall during peak hours is acceptable. Individual movements may be allowed to fall to LOS E or F at signalized intersections. Minor movements at unsignalized intersections, such as left turns onto a major arterial, may be allowed to fall below LOS D, specifically where there are low volumes and/or no viable alternative per the City of Aurora's *Traffic Impact Study Guidelines*. Criteria contained in the *HCM* was applied for these analyses in order to determine peak hour LOS for each scenario. A more detailed discussion of LOS methodology is contained in the **Appendix** for reference.

4.0 Existing Conditions

4.1 Roadways

The study area boundaries are based on the amount of traffic to be generated by the project and potential impact to the existing roadway network. The primary public roadways that serve the project site are discussed in the following text and illustrated on **Figure 1**.

Chambers Road is a six-lane, north-south, arterial roadway that provides access to residential and commercial neighborhoods near the project site. The roadway extends from 56th Avenue (north)

to Parker Road (south). Chambers Road has a posted speed limit of 40 miles per hour (mph) and serves approximately 28,900 vehicles per day (vpd) near the project site (Year 2024).

Mexico Avenue is a four-lane, east-west, arterial roadway that provides access to local residential and commercial neighborhoods. The roadway extends from Abilene Street (just west of I-225) (west) to Uravan Street (east). Mexico Avenue has a posted speed limit of 35 mph east of Chambers Road and 25 mph west of Chambers Road.

Evans Avenue is an east-west roadway that provides local access to local residential and commercial neighborhoods. The roadway extends from Elkhart Street (west) to Ivory Street (east). Evans Avenue has a posted speed limit of 25 mph.

4.2 Intersections

The study area includes two (2) existing intersections that are listed below with the current traffic control and were analyzed for existing and future background year traffic operations:

1. Chambers Road at Mexico Avenue [signalized]
2. Chambers Road at Evans Avenue [signalized]

The existing lane configuration at each of the study locations is illustrated on **Figure 3**.

A crash analysis was conducted by City Staff at the study intersections and along Chambers Road within the study area. Per City staff, the intersections and Chambers Road do not have a recent crash history.

4.3 Pedestrian and Bicycle

Currently, there are sidewalks on both sides of the study roadways.

There are no on-street bike facilities within the project study area. Bikes are permitted to travel within general purpose lanes of the study roadways.

4.4 Transit

The City of Aurora is serviced by Regional Transportation District (RTD). Bus stops for both northbound and southbound service are located at the intersections of Chambers Road and Mexico Avenue and at Chambers Road and Evans Avenue. The bus stops are serviced by Route 153 which travels north-south along Chambers Road and connects to the Aurora Metro Center Station.

4.5 Year 2024 Existing Intersection Capacity Analysis

The existing volumes, lane configuration, and traffic control are illustrated on **Figure 3**. The details of LOS for each movement are provided in **Table 1** and the 95th percentile queues are provided in **Table 2** (refer to **Appendix**). The intersection Level of Service worksheets are attached in the **Appendix**. **Currently, the study intersections operate overall at LOS C or better in both peak hours.** The following study intersections have movements that operate at LOS E during one or both peak hours:

- **#1 – Chambers Road at Mexico Avenue:** This intersection currently operates overall at LOS B in the AM peak hour and LOS C in the PM peak hour.
 - Eastbound left-turn movement was estimated to operate at LOS E in the AM peak hour. The 95th percentile queue was calculated to be up to 88 feet and is contained within the existing storage.
 - Eastbound through movement was estimated to operate at LOS E in both peak hours. The 95th percentile queue was calculated to be up to 86 feet in the AM peak hour and 210 feet in the PM peak hour.
 - Eastbound right-turn movement was estimated to operate at LOS E in the AM peak hour. The 95th percentile queue was calculated to be up to 8 feet and is contained within the existing storage.
 - Westbound left-turn movement was estimated to operate at LOS E in the PM peak hour. The 95th percentile queue was calculated to be up to 183 feet and exceeds the available storage of 180 feet.
 - Southbound left-turn movement was estimated to operate at LOS B in the AM peak hour and LOS C in the PM peak hour. The 95th percentile queue was calculated to be up to 464 feet which exceeds the available storage of 130 feet.

Recommendations: Monitor signal timing and adjust incrementally as traffic volumes dictate. It is common for side street LOS to fall below LOS D during peak hours. Lengthen turn lane storage to accommodate queues. Consider construction of a second southbound left-turn lane as the existing PM peak hour left-turn volume exceeds the 300 vehicles per hour (vph) rule-of-thumb threshold for consideration of a dual left-turn lane.

- **#2 – Chambers Road at Evans Avenue:** This intersection currently operates overall at LOS A in both peak hours.

- Eastbound left-turn movement was estimated to operate at LOS E in both peak hours. The 95th percentile queue was calculated to be up to 74 feet in the AM peak hour and 122 feet in the PM peak hour, and is contained within the existing storage.
- Eastbound through + right-turn movement operates at LOS E in both peak hours. The 95th percentile queue was calculated to be up to 45 feet in the AM peak hour and 54 feet in the PM peak hour.
- Westbound left-turn movement was estimated to operate at LOS E in both peak hours. The 95th percentile queue was calculated to be up to 106 feet in the AM peak hour and 72 feet in the PM peak hour, and exceeds the available storage of 85 feet.
- Westbound through movement was estimated to operate at LOS E in the AM peak hour. The 95th percentile queue was calculated to be up to 32 feet.
- Westbound right-turn movement was estimated to operate at LOS E in the AM peak hour. The 95th percentile queue was calculated to be up to 30 feet and is contained within the existing storage.

Recommendations: Monitor signal timing and adjust incrementally as traffic volumes dictate. It is common for side street LOS to fall below LOS D during peak hours. Lengthen turn lane storage to accommodate queues.

5.0 Future Conditions

5.1 Annual Growth Factor and Future Volume Methodology

In order to forecast the future peak hour traffic volumes, background traffic growth assumptions were estimated based the Denver Regional Council of Governments (DRCOG) FOCUS model (Version 2.3.1) as well as developable land within and near the study area.

Based on DRCOG forecasts, the annual growth for Chambers Road and Mexico Avenue ranges between 0.7% annually and 1.7% annually, with an average of 0.96%. An annual growth of **1.0%** was applied to the existing intersection volumes for the future background scenarios.

Using these assumptions, the Year 2027 background traffic is summarized on **Figure 4** and the Year 2050 background traffic is summarized on **Figure 5**.

5.2 Year 2027 Anticipated Transportation Network

This study assumes that the short-term (Year 2027) roadway network will be the same as the existing roadway network within the study area.

5.3 Year 2027 Background Intersection Capacity Analysis

The study area intersections were evaluated to determine baseline operations for the Year 2027 background scenario and to identify any capacity constraints associated with background traffic (refer to **Section 5.1** for growth assumptions). It was assumed that the signal timing changes listed in **Section 5.2** will be implemented by Year 2027 background. The background volumes, lane configuration, and traffic control are illustrated on **Figure 4**.

The Level of Service criteria discussed previously was applied to the study area intersections to determine the impacts with the short-term background volumes. This analysis assumes signal timing throughout the network would be adjusted to accommodate changes in traffic volumes. The details of LOS for each movement are provided in **Table 1** and the 95th percentile queues are provided in **Table 2** (refer to **Appendix**). The intersection Level of Service worksheets are attached in the **Appendix**.

In summary, all of the study intersections were estimated to operate similarly to the Year 2024 Existing scenario, with no changes to overall or movement LOS and minor changes to queue length.

5.4 Year 2050 Anticipated Transportation Network

This study assumes that, due to high turning volumes exceeding the 300 vph rule-of-thumb threshold for consideration of a dual left-turn lane, a second southbound left-turn lane will be installed at the intersection of Chambers Road and Mexico Avenue prior to the Year 2050 Background scenario and is shown on **Figure 5**. Note that signal timing at this intersection was modified to make the southbound left-turn a protected-only phase when it operates as a dual left-turn.

It is also assumed that auxiliary turn lane storages will be increased to accommodate the calculated 95th percentile queues at both study intersections, as shown on **Table 2** and listed below:

- #1 – **Chambers Road at Mexico Avenue**
 - Westbound left-turn lane: total lane length of 430 feet (310 feet of storage plus 120 feet of taper).
 - Westbound right-turn lane: total lane length of 510 feet (390 feet of storage plus 120 feet of taper).

- Southbound dual left-turn lane: total combined lane length of 409 feet (265 feet of storage plus 144 feet of taper).

- **#2 – Chambers Road at Evans Avenue**

- Eastbound left-turn lane: total lane length of 255 feet (165 feet of storage plus 90 feet of taper).
- Westbound left-turn lane: total lane length of 230 feet (140 feet of storage plus 90 feet of taper).

5.5 Year 2050 Background Intersection Capacity Analysis

The study area intersections were evaluated to determine baseline operations for the Year 2050 background scenario and to identify any capacity constraints associated with background traffic in the long-term scenario (refer to **Section 5.1** for growth assumptions). The long-term background volumes, lane configuration, and traffic control are illustrated on **Figure 5**.

The Level of Service criteria discussed previously was applied to the study area intersections to determine the impacts with the long-term background volumes. The analysis assumed the signal timing at all signalized intersections would be adjusted to accommodate the additional lanes and change in traffic volumes. It should be noted that the peak hour factors were adjusted to 0.92 on all roadways (if the existing factor is less than 0.92) since it is assumed that the peak periods will become longer with peak hour traffic spread more evenly over the hour as traffic increases.

The details of LOS for each movement are provided in **Table 1** and the 95th percentile queues are provided in **Table 2** (refer to **Appendix**). The intersection Level of Service worksheets are attached in the **Appendix**.

In summary, majority of the of the study intersections were estimated to operate overall at LOS C or better in both peak periods and the majority of movements were calculated to operate at LOS D or better. The following intersections or movements were calculated to operate at LOS E in one or both peak hour in Year 2050 background as described below:

- **#1 – Chambers Road at Mexico Avenue** was estimated to operate overall at LOS C in both peak hours.
 - Eastbound through movement was estimated to operate at LOS E in the PM peak hour. The 95th percentile queue was calculated to be up to 277 feet.

-
- Westbound left-turn movement was estimated to operate at LOS E in both peak hours. The 95th percentile queue was calculated to be up to 305 feet in the AM peak hour and 223 feet in the PM peak hour and will be contained within the available storage.
 - Westbound right-turn movement was estimated to operate at LOS E in the AM peak hour. The 95th percentile queue was calculated to be up to 384 feet and will be contained within the available storage.
 - Southbound left-turn movement was estimated to operate at LOS E in both peak hours. The 95th percentile queue was calculated to be up to 122 feet in the AM peak hour and 245 feet in the PM peak hour and will be contained within the available storage.

Recommendations: Monitor signal timing and adjust incrementally as traffic volumes dictate. It is common for side street LOS to fall below LOS D during peak hours.

6.0 Future Conditions with the Development

The 1900 S Chambers Road project will be comprised of 60 units of attached affordable housing, and for the purpose of this traffic study it was assumed that the entire project will be built out and occupied by Year 2027.

While the addition of a new access on Chambers Road adds the potential for vehicle conflict points, this potential is reduced by limiting the access to right-in, right-out operations.

6.1 Trip Generation

A trip generation estimate was performed to determine the traffic characteristics of the proposed development. The trip rates contained in the Institute of Transportation Engineers (ITE) Trip Generation Handbook and Manual² were applied to estimate the traffic for the dwelling units. This study applied the trip rates for “Affordable Housing – Income Limits” [ITE #223]. Although the project is for supportive housing, the “income limit” trips rates were used per City input as the “special needs” trip rates are primarily used for “dense multi-use urban” locations. Using “income limit” rates is a conservative approach which results in higher traffic volumes associated with the project. The office space for mental

² Trip Generation Handbook and Manual, 11th Edition, Institute of Transportation Engineers, 2021.

health providers did not have a strong corollary with any land uses in the *Trip Generation Handbook*. The closest ITE land use would be “Small Office Building” [ITE #712]. However, because the mental health providers utilizing this office space will only provide services to residents of the 1900 S Chambers Road project, it was determined that a typical office building land use would not have similar trip generation characteristics. The project team anticipates that three (3) full-time staff will use the office space, and therefore this study anticipates all three (3) staff will arrive to the project site in the AM peak hour and depart the project site in the PM peak hour. This assumption yields higher AM and PM peak hour trip generation than ITE #712, and is therefore conservatively high.

The 1900 S Chambers Road project was estimated to generate approximately 301 daily trips with 33 trips in the AM peak hour and 31 trips in the PM peak hour. Trip generation is described on **Table 3**.

6.2 Trip Distribution and Assignment

The estimated trip volumes were distributed onto the study area street network based on existing traffic characteristics, land uses, and traffic patterns in the area. The existing volumes were utilized to determine where vehicles are coming from and going to within the study area, plus the route to get to major highways and anticipated destinations.

The following distributions were assumed for this project and are shown on **Figure 6**:

- North Chambers Road: 44%
- South Chambers Road: 44%
- West Mexico Avenue: 5%
- East Mexico Avenue: 5%
- West Evans Avenue: 1%
- East Evans Avenue: 1%

Using the distribution assumptions, the projected site traffic was assigned to the study area roadway network for the weekday AM and PM peak hour periods. Project-generated trips are shown on **Figure 7**.

6.3 Year 2027 Background + Project Intersection Capacity Analysis

This section discusses impacts associated with the addition of the project trips in the short-term scenario. The site-generated volumes were added to the Year 2027 background volumes and are illustrated on **Figure 8**. This figure also illustrates the necessary traffic control and lane configurations for the proposed access.

The study intersections are anticipated to operate similarly to the background conditions with the addition of project trips since most of the intersection and movement levels of service remain the same letter grade. The proposed access is anticipated to operate at LOS A in both peak hours with all movements operating at LOS C or better. The details of LOS for each movement are provided in **Table 1** and the 95th percentile queues are provided in **Table 2** (refer to **Appendix**). The intersection Level of Service worksheets are attached in the **Appendix**.

6.4 Year 2050 Background + Project Intersection Capacity Analysis

This section discusses impacts associated with the addition of the project trips in the long-term scenario. The site-generated volumes were added to the Year 2050 background volumes and are illustrated on **Figure 9**. This figure also illustrates the necessary traffic control and lane configurations for all of the study intersections and proposed access. The recommended improvements in the Year 2050 background scenario were assumed to be implemented.

The study intersections are anticipated to operate similarly to the background conditions with the addition of project trips since most of the intersection and movement levels of service remain the same letter grade. The proposed access is anticipated to operate at LOS A in both peak hours with all movements operating at LOS C or better. The details of LOS for each movement are provided in **Table 1** and the 95th percentile queues are provided in **Table 2** (refer to **Appendix**). The intersection Level of Service worksheets are attached in the **Appendix**.

7.0 Queuing Analysis

A queuing analysis was performed to determine if the 95th percentile queues would be accommodated by the existing storage length, to determine the storage lengths for future auxiliary lanes, and if any of the queues would impact an upstream intersection/access. **Table 2** provides the existing and proposed storage lengths, as well as the 95th percentile queues for each existing and future scenario as calculated by Synchro (assuming each vehicle utilizes 25 feet of space). It should be noted that the 95th percentile queue length is a theoretical queue that is 1.65 standard deviations above the average queue length. In theory, the 95th percentile queue would be exceeded 5% of the time based on the average queue length, but it is also possible that a queue this long may not occur.

As shown in **Table 2**, majority of the queues are shorter than the provided storage length in all scenarios. The project trips have minimal impact on queues at the existing study intersections.

Recommended turn lanes storage lengths and taper lengths are also listed in **Table 2**, which are based on the volume thresholds set forth in the CDOT *State Highway Access Code* for the assumed posted speed of each study roadway. For the purposes of this study, the study area roadways were considered classified as NR-B (non-rural arterial roadway).

8.0 Conclusions

The 1900 S Chambers Road project plans to develop vacant land with 60 attached affordable housing dwelling units for residents meeting a 30% adjusted median income requirement, as well as approximately 995 square feet of office space for non-profit mental health providers. The project proposes to construct one (1) access on Chambers Road. The access is proposed to be right-in, right-out and side-street stop-controlled. For the purpose of this traffic study, it was assumed that the project will be built out and occupied by Year 2027.

The project is estimated to generate approximately 301 daily trips with up to 33 trips occurring in the AM peak hour and up to 31 trips occurring in the PM peak hour. **It was determined that the proposed roadway system can adequately accommodate the projected traffic volumes.** The recommendations listed on the following pages should be considered.

Existing/Background Conditions (Non-Project Related):

- **Chambers Road at Mexico Avenue**
 - Lengthen turn lane storage to accommodate queues. Construct second southbound left-turn lane. *[Year 2024 Existing]*
 - Monitor signal timing and adjust incrementally as traffic volumes dictate. *[All scenarios]*
- **Chambers Road at Evans Avenue**
 - Lengthen turn lane storage to accommodate queues. *[Year 2024 Existing]*
 - Monitor signal timing and adjust incrementally as traffic volumes dictate. *[All scenarios]*

Project Conditions:

- **Chambers Road at Mexico Avenue** – Monitor signal timing and adjust incrementally as traffic volumes dictate. *[All scenarios]*
- **Chambers Road at Evans Avenue** –Monitor signal timing and adjust incrementally as traffic volumes dictate. *[All scenarios]*

The proposed lengths of auxiliary lanes are listed in **Table 2**. Note that the traffic study provides technical information and evaluates the need for transportation mitigation as traffic grows, but it does not address infrastructure commitments or obligations of the 1900 S Chambers Road project.

Level of Service Definitions

Existing Traffic Data

Intersection Capacity Worksheets

Level of Service Definitions

LEVEL OF SERVICE DEFINITIONS

In rating roadway and intersection operating conditions with existing or future traffic volumes, “Levels of Service” (LOS) A through F are used, with LOS A indicating very good operation and LOS F indicating poor operation. Levels of service at signalized and unsignalized intersections are closely associated with vehicle delays experienced in seconds per vehicle. More complete level of service definitions and delay data for signal and stop sign controlled intersections are contained in the following table for reference.

Level of Service Rating	Delay in seconds per vehicle (a)		Definition
	Signalized	Unsignalized	
A	0.0 to 10.0	0.0 to 10.0	Low vehicular traffic volumes; primarily free flow operations. Density is low and vehicles can freely maneuver within the traffic stream. Drivers are able to maintain their desired speeds with little or no delay.
B	10.1 to 20.0	10.1 to 15.0	Stable vehicular traffic volume flow with potential for some restriction of operating speeds due to traffic conditions. Vehicle maneuvering is only slightly restricted. The stopped delays are not bothersome and drivers are not subject to appreciable tension.
C	20.1 to 35.0	15.1 to 25.0	Stable traffic operations, however the ability for vehicles to maneuver is more restricted by the increase in traffic volumes. Relatively satisfactory operating speeds prevail, but adverse signal coordination or longer vehicle queues cause delays along the corridor.
D	35.1 to 55.0	25.1 to 35.0	Approaching unstable vehicular traffic flow where small increases in volume could cause substantial delays. Most drivers are restricted in ability to maneuver and selection of travel speeds due to congestion. Driver comfort and convenience are low, but tolerable.
E	55.1 to 80.0	35.1 to 50.0	Traffic operations characterized by significant approach delays and average travel speeds of one-half to one-third the free flow speed. Vehicular flow is unstable and there is potential for stoppages of brief duration. High signal density, extensive vehicle queuing, or corridor signal progression/timing are the typical causes of vehicle delays at signalized corridors.
F	> 80.0	> 50.0	Forced vehicular traffic flow and operations with high approach delays at critical intersections. Vehicle speeds are reduced substantially, and stoppages may occur for short or long periods of time because of downstream congestion.

(a) Delay ranges based on Highway Capacity Manual (6th Edition, 2016) criteria.

Intersection Summary

Cycle Length: 135

Actuated Cycle Length: 135

Offset: 0 (0%), Referenced to phase 2:NBT and 6:SBTL, Start of Yellow

Natural Cycle: 85

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Chambers Rd & Mexico Ave

Intersection Summary

Cycle Length: 140

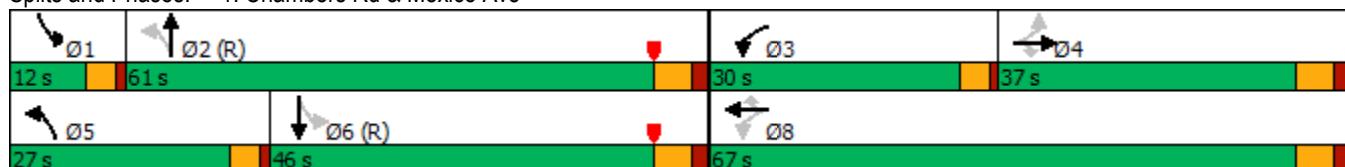

Actuated Cycle Length: 140

Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBL, Start of Yellow

Natural Cycle: 140

Control Type: Actuated-Coordinated

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: Chambers Rd & Evans Ave

Intersection Summary

Cycle Length: 135

Actuated Cycle Length: 135

Offset: 0 (0%), Referenced to phase 2:NBT and 6:SBTL, Start of Yellow

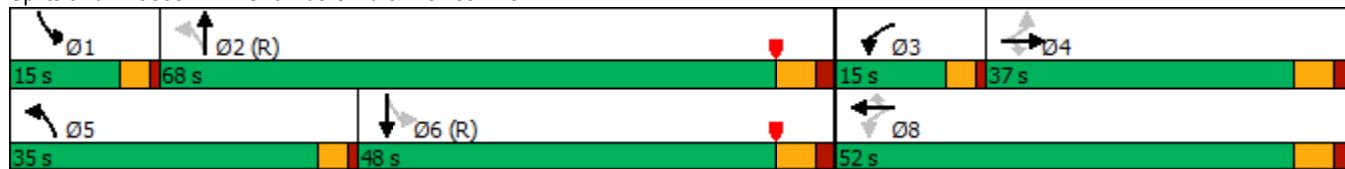

Natural Cycle: 95

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Chambers Rd & Mexico Ave

Intersection Summary

Cycle Length: 135

Actuated Cycle Length: 135

Offset: 0 (0%), Referenced to phase 2:NBT and 6:SBT, Start of Yellow

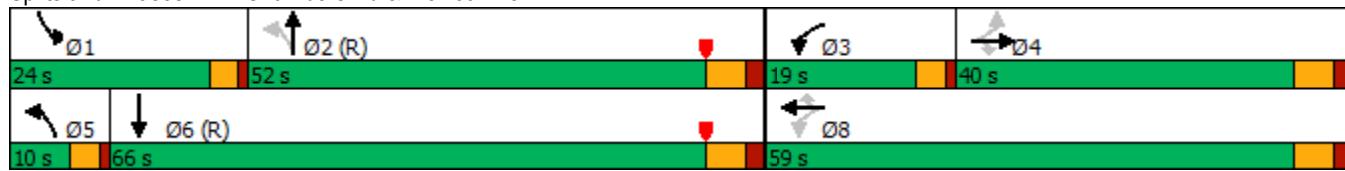

Natural Cycle: 105

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Chambers Rd & Mexico Ave
