Re: DIA Buildings I & II – Porteos
Traffic Study Letter
Aurora, Colorado

Dear Mr. Smith:

This traffic study letter documents a trip generation comparison to identify conformance with the original traffic impact study for the two (2) proposed industrial buildings located on the southeast corner of the 64th Avenue and Powhaton Road intersection in Aurora, Colorado. Additionally, an intersection analysis for the 64th Avenue and Powhaton Road intersection, a turn lane analysis, and a signal warrant analysis is included in this letter for a short-term buildout year of 2025 as well as the long-term 2040 horizon. Building I is proposed to provide a building area of 624,101 square feet and Building II is proposed to provide 600,000 square feet, totaling 1,224,101 square feet. A conceptual site plan is attached, and the site area is illustrated in **Figure 1** attached.

Regional access will be provided by Interstate 70 (I-70), Interstate 225 (I-225), E-470, and Pena Boulevard. Primary access to the site will be provided by 56th Avenue, 64th Avenue, Jackson Gap Street, and Powhaton Road. Direct access to the project is proposed from two full movement accesses along the south side of 64th Avenue and two full movement accesses along the east side of Powhaton Road. Additionally, an inbound only access is proposed to serve both buildings along Powhaton Road.

PROJECT ACCESS

This development was studied within the *Porteos Industrial Traffic Impact Study* prepared by Kimley-Horn in August 2021. The original traffic study included two industrial buildings totaling 1,653,000 square feet. Two full movement accesses along the south side of 64th Avenue were proposed and are currently constructed since Building I is already built. However, accesses along Powhaton Road have not yet been constructed.

The current proposal includes closing the recently constructed east access along 64th Avenue and constructing an access approximately 380 feet east of the existing access. The west driveway along 64th Avenue and the proposed north access along Powhaton Road will serve as employee access for Building I. The east driveway will serve as a truck outbound only access for Building I and allow for two-way traffic to access Building II. A driveway south of the northern driveway along Powhaton Road is proposed to serve as a shared inbound only entrance for Building I and II traffic. Lastly, a full movement access is proposed on the south end of the site to serve only Building II traffic along Powhaton Road.

TRIP GENERATION

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land use to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation rates is the *Trip Generation Manual*¹ published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses.

From the original traffic study, the trip generation was based on ITE Trip Generation, 10th Edition (most recent at the time of the study) rates for the Industrial Park (ITE Code 130) land use. For the current proposal, the trip generation is based on the most recent ITE Trip Generation, 11th Edition rates for Industrial Park (ITE Code 130) land use for Building II. However, site-specific trip generation data is provided for Building I by the client. The following **Table 1** summarizes the anticipated trip generation for DIA Building I & II compared to the trip generation for the previously studied Porteos Industrial development (trip generation calculations and original study trip generation table are attached).

Table 1 –Trip Generation Comparison

Use and Size	Daily Vehicle Trips	Weekday Vehicle Trips					
		AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
Original Traffic Study							
Industrial Park (ITE 10 th Edition 130) 1,653,000 SF (Both Buildings)	5,572	535	126	661	139	523	662
Current Proposal							
Client Specific 624,101 SF (Building I)	3,600	113	36	149	84	466	550
Industrial Park (ITE 11 th Edition 130) 600,000 SF (Building II)	2,022	165	39	204	45	159	204
Total Project Trips	5,572	278	75	353	129	625	754
Net Difference in Trips	+50	-257	-51	-308	-10	+102	+92

As summarized in **Table 1**, the current proposal for the site is proposed to provide two industrial buildings total 1,224,101 square feet that are anticipated to generate 5,572 daily trips with 353 trips occurring during the morning and 754 trips occurring during the afternoon. The current proposal generates 50 more daily trips with 308 fewer trips in the morning peak hour, and 92 more trips in the afternoon peak hour when compared to the original traffic study. Even though the new proposal generates more trips than the original traffic study, the following sections will demonstrate the increase in trips does not change the original TIS intersection recommendations.

¹ Institute of Transportation Engineers, *Trip Generation: An Information Report*, Eleventh Edition, Washington DC, 2021.

TRIP DISTRIBUTION AND TRAFFIC ASSIGNMENT

Distribution of site traffic on the street system was based on the area street system characteristics, existing traffic patterns, existing and anticipated surrounding demographic information, and the proposed access system for the project. The directional distribution of traffic is a means to quantify the percentage of site-generated traffic that approaches the site from a given direction and departs the site back to the original source. The traffic assignment was obtained by applying the project trip distribution to the estimated traffic generation of the development shown in **Table 1**. **Figure 3** and **Figure 4** illustrates the trip distribution for the Building I employees and Building I truck traffic, respectively. **Figure 5** illustrates the traffic assignment for Building I. Likewise, **Figure 6** illustrates the trip distribution for Building II and **Figure 7** illustrates the traffic assignment for Building II. Of note, the trip distribution may evolve once the surrounding roadway network is constructed.

INTERSECTION ANALYSIS

EXISTING ROADWAY NETWORK

The existing intersection of 64th Avenue and Powhaton Road operates under stop control on all four approaches. The eastbound 64th Avenue approach and the northbound Powhaton Road approach provides a separate left turn lane, a through lane, and a right turn lane. The westbound and southbound approaches provide a left turn lane, a through lane, and a share through/right turn lane. The existing intersection geometry and control has evolved since the original Porteos Industrial Traffic Study was completed for existing conditions. An aerial of the intersection geometry is shown below.

EXISTING AND FUTURE TRAFFIC VOLUMES

Existing turning movement counts were conducted at the study intersection on Wednesday, February 21, 2024 during the morning and afternoon peak hours. The counts were conducted during the morning and afternoon peak hours of adjacent street traffic in 15-minute intervals from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM on this count date. The existing intersection traffic volumes and geometry and control are also shown in attached **Figure 2** with count sheets attached.

To generate 2025 traffic volumes, a two (2) percent annual growth rate used which is consistent with City of Aurora growth rates. Additionally, the Porteos PA 5 – JAG Logistics Center at DIA and Porteos PA 3 – Jackson Gap Commercial in Aurora developments were included in the background traffic volumes.

The long-term 2040 traffic volumes were developed from adding the project traffic trips directly to the projected 2040 background traffic volumes provided in the original TIS at the 64th Avenue and Powhaton Road intersection. The background 2040 traffic volumes are attached for reference.

The external trip distribution remains the same as the original traffic study; however, the internal trip distribution percentages at the accesses have been refined to align with the current access plan. The traffic assignment was obtained by applying the project trip distribution to the estimated traffic generation of the development shown in **Table 1**. **Figure 8** illustrates the total traffic volumes for the 2025 horizon and **Figure 9** illustrates the total traffic volumes for the long-term 2040 horizon.

TRAFFIC OPERATION ANALYSIS METHODOLOGY

Kimley-Horn's analysis of traffic operations in the site vicinity was conducted to determine potential capacity deficiencies at the project key intersections for the 2025 opening horizon and the requested long-term 2040 horizon. Capacity analysis results are listed in terms of Level of Service (LOS). LOS is a qualitative term describing operating conditions a driver will experience while traveling on a particular street or highway during a specific time interval. It ranges from A (very little delay) to F (long delays and congestion). According to City of Aurora guidelines for signalized intersections, individual movements may be allowed to fall to LOS E, but in most cases the overall intersection must operate (or be projected to operate) at a LOS D or better during AM and PM peak periods. If the existing LOS for an intersection is worse than LOS D, potential alternatives to improve the intersection to achieve LOS D should be provided or maintain the existing critical lane volume with the addition of site generated traffic. Minor movements at unsignalized intersections, such as left turns onto a major arterial from a side street, may be allowed to fall below LOS D pending the specific conditions. Movements which have a light traffic demand, and a viable travel alternative may be allowed to fall below LOS D. Calculations for the level of service at the key intersections identified for the study are attached.

Synchro traffic analysis software was used to analyze the 64th Avenue and Powhaton Road intersection and the project accesses for level of service. The Synchro Highway Capacity Manual (HCM) methodology reports were used to analyze intersection delay and level of service. **Table 2** summarizes the existing level of service conditions at the 64th Avenue/Powhaton Road intersection while **Table 3** summarizes the level of service conditions for the study intersection and accesses during the short-term and long-term horizons.

= Long-Term Roadway Recommendations

As summarized in the **Table 3**, all movements are anticipated to operate acceptably through the long-term horizon.

The long-term roadway recommendations are consistent with the original TIS. The intersection of 64th Avenue/Powhaton Road will be signalized with dual northbound left turn lanes in the long-term. Additionally, 64th Avenue is planned to be widened to a five-lane roadway section with a two-way left turn center lane.

TURN LANE WARRANT

The City of Aurora defaults to the Colorado Department of Transportation (CDOT) State Highway Access Code guidelines to determine if turn lanes are warranted at studied intersections. CDOT classifies their state highways based on roadway types. It is believed that Powhaton Road and 64th Avenue match the characteristics of a CDOT NR-B roadway. According to the State Highway Access Code for category NR-B roadways, the following threshold applies for determining the need for a turn lane:

- A left turn lane with storage length plus taper length is required for any access with a projected peak hour left ingress turning volume greater than 25 vehicles per hour (vph). If the posted speed is greater than 40 mph, a deceleration lane and taper is required for any access with a projected peak hour left ingress turning volume greater than 10 vph.
- A right turn lane with storage length plus taper is required for any access with a projected peak hour right ingress turning volume greater than 50 vehicles per hour. If the posted speed limit is greater than 40 miles per hour, a right turn lane deceleration lane and taper is required for any access with a project peak hour right ingress turning volume greater than 25 vehicles per hour.

Table 4 below summarizes the turn lane warrant evaluation for the short-term horizon.

Table 4 –Turn Lane Warrant Evaluation for Buildout

Intersection	AM / PM Volumes	Threshold (vph)	Warranted?	Turn Lane Length 2025	95 th % Queue (ft) 2025
Powhaton Bldg I Full Access (#2) Northbound Right Southbound Left	46 / 34 9 / 7	50 25	No No	Continuous TWLTL	25' 25'
Powhaton Bldg I & II Full Access (#3) Northbound Right Southbound Left	28 / 14 44 / 18	50 25	No Yes	Continuous TWLTL	25' 25'
64 th Ave West Access (#4) Eastbound Right Westbound Left	36 / 27 0 / 0	50 25	No No	- -	DNE DNE
64 th Ave East Access (#5) Eastbound Right Westbound Left	33 / 9 0 / 0	50 25	No No	- -	DNE DNE
Powhaton Bldg II Full Access (#6) Northbound Right Southbound Left	66 / 18 15 / 4	50 25	Yes (2040) No	225'+145'T TWLTL	25' 25'

Of note, left turn lanes along Powhaton Road can be accommodated within the existing two-way left turn center lane. As noted, the northbound right turn lanes can be waived during the short-term horizon based on the Colorado Department of Transportation (CDOT) State Highway Access Code

since the adjacent through volumes are less than 150 vehicles per hour in each travel lane or the right turn movement is not greater than 50 vehicles per hour to warrant an auxiliary right turn lane. However, the development is planning to provide a continuous right turn lane from the Building II full movement access to the Building I full movement access. Of note, by 2040, the westbound left turn lanes along 64th Avenue will be included within the future two-way left turn center lane.

Additionally, the 95th percentile reported queue lengths for the buildout year are not anticipated to exceed the existing or recommended turn lengths. The reported queue length is one vehicle or less for all the movements at the study accesses.

The short-term intersection recommendations and control are illustrated in **Figure 10** and for the long-term intersection recommendations and control are illustrated in **Figure 11** attached.

SIGNAL WARRANT ANALYSIS

A four-hour signal warrant analysis was completed at the intersection of 64th Avenue and Powhaton Road to project the signalization timeline. The total 2025 traffic volumes were used in the four-hour MUTCD signal warrant analysis. These volumes included DIA Building I and II, Porteos PA 3 (located on the northeast corner of 64th Avenue and Jackson Gap Street intersection), and Porteos PA-5 (located north of 64th Avenue, on the west side of Powhaton Road). As shown in **Table 5** below, the volumes are not nearing the signal warrant volume threshold since none of the hours meet the volume threshold of warranting a signal. Additionally, the attached MUTCD Figure 4C-2 is attached for reference.

Table 5 –Signal Warrant Analysis

CONCLUSIONS

In summary, the current proposal generates 50 more daily trips with 308 fewer trips in the morning peak hour, and 92 more trips in the afternoon peak hour when compared to the original traffic study. However, the existing intersection geometry and control at 64th Avenue and Powhaton Road is reported to accommodate the project traffic and the background traffic in 2025. Therefore, the project is believed to be in traffic compliance with the *Porteos Industrial Traffic Impact Study* intersection short term and long-term recommendations at the study intersection. However, the recommendation changes from the original traffic study at the access intersections are the following:

- Close the existing east access along 64th Avenue and provide a new access (#5) approximately 380 feet east of the closed access. The northbound approach of this access is recommended to operate with stop control with separate left and right turn lanes. No turn lanes are warranted along 64th Avenue into the site access.
- The inbound only access (#3) has evolved from the full movement access originally proposed in the traffic study. This access is proposed to restrict conflicting movements by only allowing southbound left and northbound right movements into the access.
- Northbound right turn lanes are not warranted at the project accesses along Powhaton Road in the short-term horizon based on the adjacent through traffic being less than 150 vehicles per lane. However, the development is planning to construct a northbound right continuous turn lane from Building II full movement access to Building I full movement access.

By the long-term horizon and full buildout of the surrounding developments, the intersection of 64th Avenue and Powhaton Road is anticipated to need dual northbound left turn lanes and is expected to warrant signalization. Additionally, 64th Avenue is planned to be widened to provide two through lanes in each direction. These recommendations are consistent with the original TIS recommendations. If you have any questions or require anything further, please feel free to call me at (720) 943-9962.

Sincerely,

KIMLEY-HORN AND ASSOCIATES, INC.

Mary Gormley, P.E.
Project Traffic Engineer

4.0 PROJECT TRAFFIC CHARACTERISTICS

4.1 Trip Generation

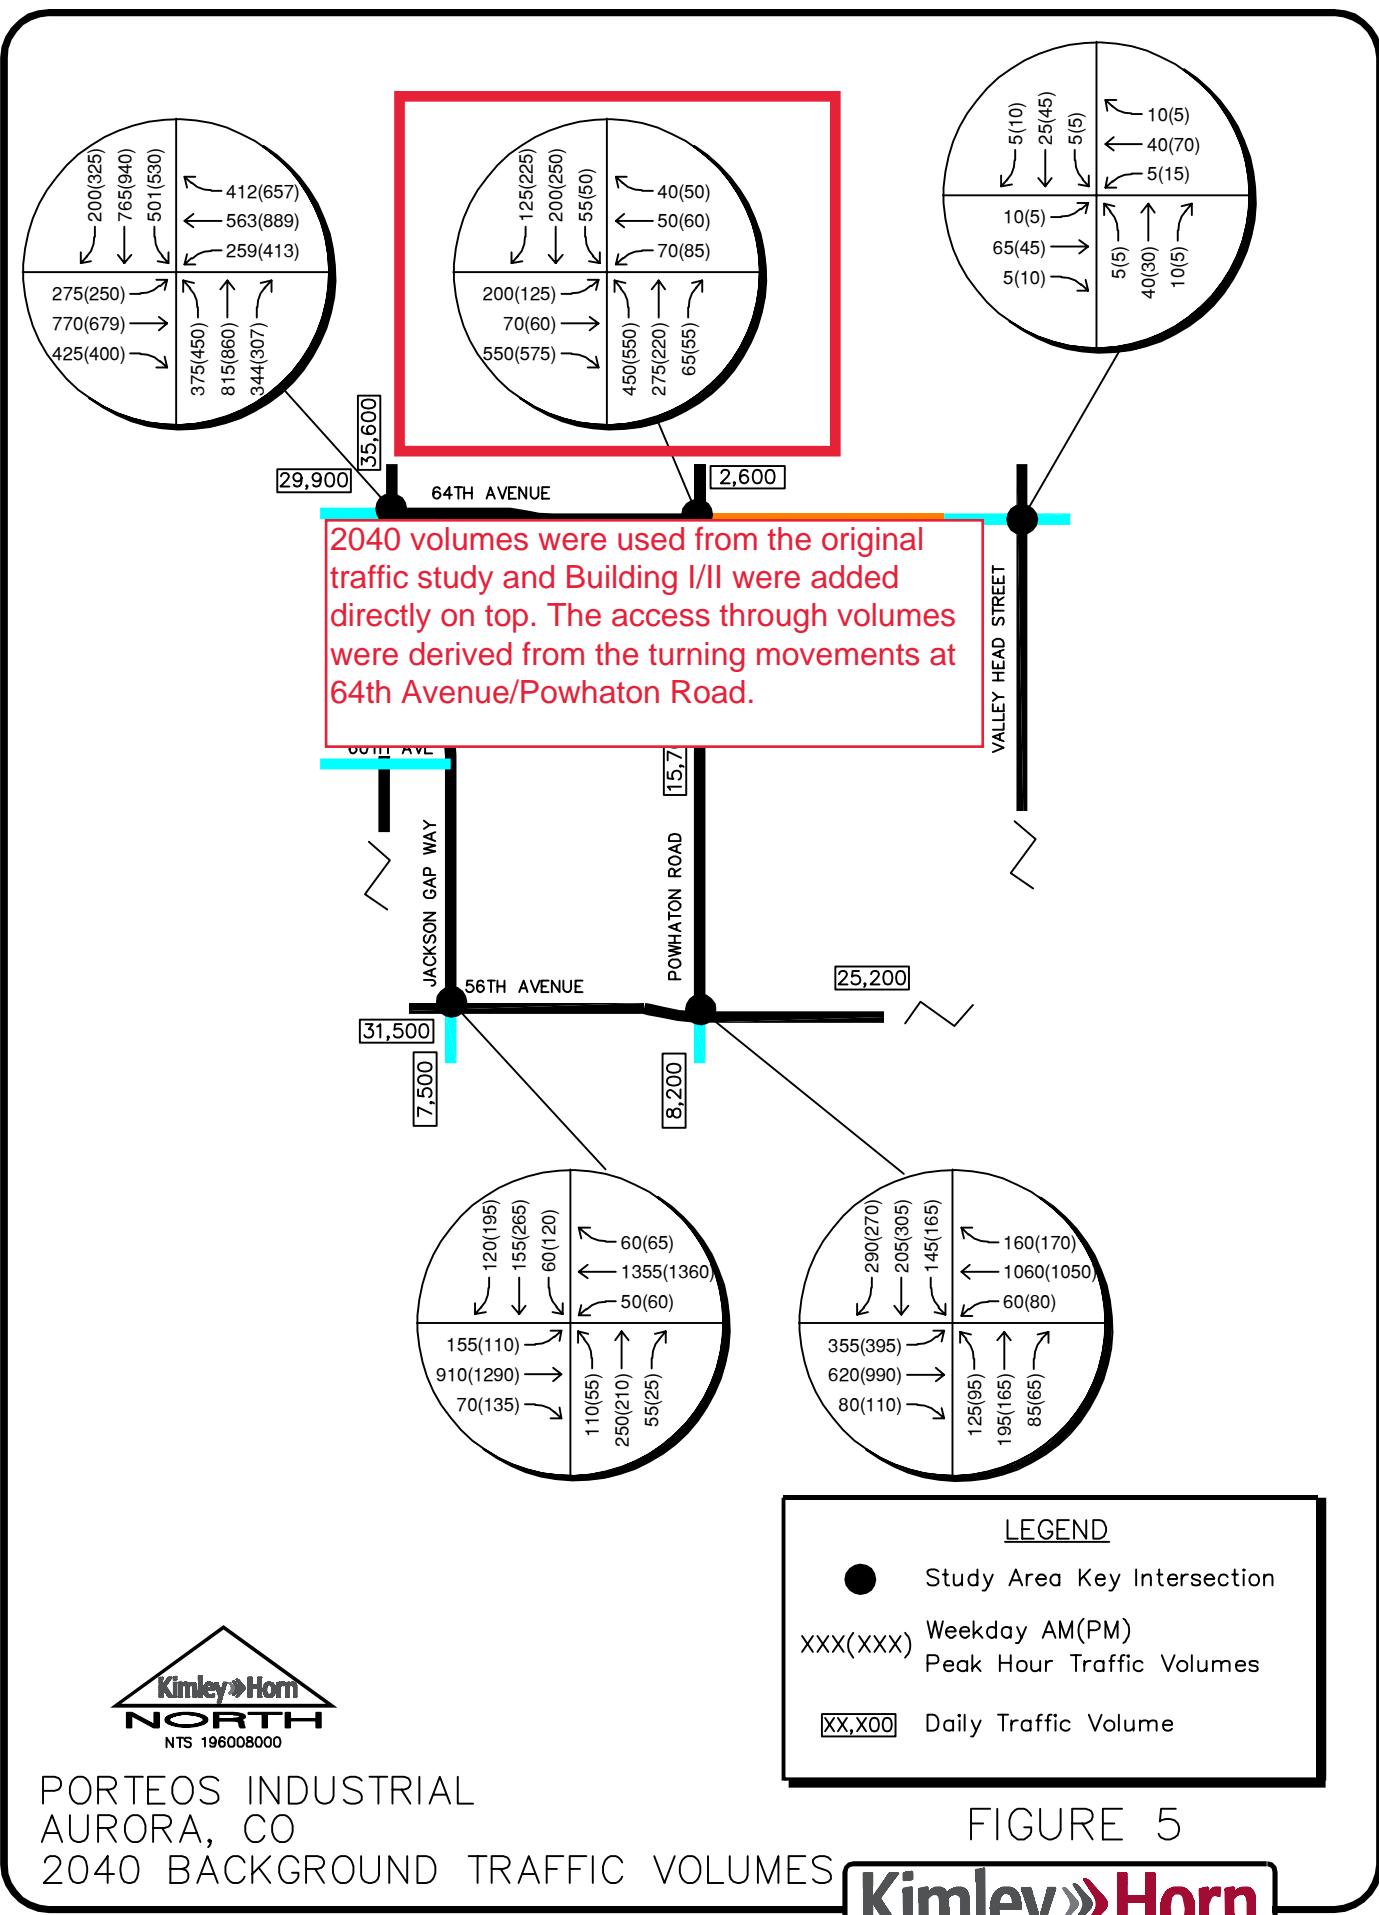

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land uses to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation rates is the *Trip Generation Manual*¹ published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses. For this study, Kimley-Horn used the ITE Trip Generation Report average rates that applies to Industrial Park (ITE Code 130) for traffic associated with the development.

For the purposes of this analysis, the project is anticipated to include approximately 1,653,000 square feet of industrial building space. The Porteos Industrial project is expected to generate approximately 5,572 daily weekday trips, with 661 trips occurring during the morning peak hour and 662 trips occurring during the afternoon peak hour. Calculations were based on the procedure and information provided in the ITE *Trip Generation Manual, 10th Edition – Volume 1: User's Guide and Handbook*, 2017. **Table 1** summarizes the estimated trip generation for the proposed development. The trip generation worksheets are included in **Appendix B**.

 Checked by _____ Date _____ Sheet No. _____ of _____

TRIP GENERATION MANUAL TECHNIQUES

ITE Trip Generation Manual 11th Edition, Average Rates

Land Use Code - Industrial Park (130)

Independent Variable - 1000 Square Feet (X)

$$SF = 600,000$$

$$X = 600.000$$

T = Average Vehicle Trip Ends

Peak Hour of Adjacent Street Traffic, One Hour Between 7 and 9 a.m. (100 Series Page 49)

$(T) = 0.34 (X)$ $(T) = 0.34 * (600.0)$	Directional Distribution: 81% ent. 19% exit. T = 204 Average Vehicle Trip Ends 165 entering 39 exiting 165 + 39 = 204
--	--

Peak Hour of Adjacent Street Traffic, One Hour Between 4 and 6 p.m. (100 Series Page 50)

$(T) = 0.34 (X)$ $(T) = 0.34 * (600.0)$	Directional Distribution: 22% ent. 78% exit. T = 204 Average Vehicle Trip Ends 45 entering 159 exiting 45 + 159 = 204
--	--

Weekday (100 Series Page 48)

Average Weekday $(T) = 3.37 (X)$ $(T) = 3.37 * (600.0)$	Directional Distribution: 50% ent. 50% exit. T = 2022 Average Vehicle Trip Ends 1011 entering 1011 exiting 1011 + 1011 = 2022
---	--
