I. INTRODUCTION

TransPort Colorado, a multi-year master-planned business environment in the City of Aurora, is planning to construct the first two parcels of its overall development area. These two parcels will include a 288,000 square foot (sf) warehouse along with a rail transload facility that will eventually provide short-line rail access for numerous TransPort Colorado warehouse and industrial parcels. Originally, the transload facility will provide rail delivery of goods and materials to the proposed warehouse.

These first two parcels will be located along 32nd Avenue near Manila Road in the approximate southeast quadrant of TransPort Colorado. Given the industrial/warehousing nature of these sites, the primary access route will be along Manila Road to/from the I-70/Manila Road interchange, while secondary access will be provided to/from the west via 32nd Avenue and Imboden Road. **Figure I** provides a vicinity map of the two site locations.

The components of this Traffic Impact Analysis (TIA) are based on engineering judgment with an understanding of information typically of interest to the Colorado Department of Transportation (CDOT). This report provides an assessment of the traffic impacts related to the development of the first two parcels and it includes estimates of traffic growth not related to TransPort Colorado, particularly the Rocky Mountain Rail Park and its influence at CDOT managed intersections.

Specific elements of this report include:

- Evaluation of existing operational conditions
- Background traffic projections for the Years 2025 and 2040
- Trip generation estimates for the proposed land uses
- Analysis of project impacts
- Traffic signalization warrant information
- Discussion on pedestrian connectivity
- Recommendations for public improvements

Of note, this report uses the Denver Regional Council of Governments travel demand model for 2040 to understand traffic volume growth rates for estimating future traffic conditions.

Map

II. EXISTING CONDITIONS

II.A. Land Use

The land areas near the first two parcels are largely undeveloped with the exception of the Colorado Air and Space Port (Space Port) to the north and some single-family homes along the south side of US 36 adjacent Petterson Road. Residential and commercial uses exist in the Towns of Watkins and Bennett along with small residential enclaves somewhat distant from the project site.

II.B. Roadway System

Several existing roadways are spaced along 1-mile land sections, although most of these roads currently have very little traffic and are somewhat discontinuous. One interstate highway and one United States highway will provide access routes for the first two parcels. **Figure 2** provides a representation of the surrounding roadway network, its laneage, and its speed limit characteristics. Following are more detailed descriptions of the primary roadways adjacent and near the project site.

Interstate 70 (I-70)

I-70 is a major interstate route that bisects the State of Colorado at its approximate north/south midpoint. Not only is this route the primary east/west corridor for interstate travel in Colorado, but this route provides access to numerous states outside Colorado, from Utah to Maryland. I-70 has four travel lanes for vehicle movements and is posted with a speed limit of 75 miles per hour (MPH).

There are two interchanges with I-70 near the project site. The Manila Road interchange is near the midpoint of TransPort Colorado and is proposed to be one of the primary interstate access routes for the TransPort Colorado land uses, including the first two parcels. Four miles to the west of the Manila Road interchange is the Watkins Road interchange.

United States 36 (US 36)

US 36 traverses the project area in an east/west alignment and it is directly adjacent to Union Pacific Railroad (UPRR) trackage that will provide rail access for the transload facility. The centerline-to-centerline distance between these two facilities is approximately 250 feet. US 36 is two lanes wide and it has a posted speed limit of 55 MPH. Several section line roadways intersect US 36, and each intersecting roadway is controlled by stop signs at US 36. CDOT classifies US 36 as a Rural Highway (R-B) in this area.

Imboden, Quail Run, Cavanaugh, Manila, Petterson, and Schumaker Roads

Each of these roadways exist at 1-mile intervals adjacent, within, or near TransPort Colorado, with each having a north/south orientation. Only Imboden and Petterson Roads are continuous for any significant distance adjacent to TransPort Colorado, however. Both of these roadways extend from US 36 to the north past the TransPort Colorado boundary. Quail Run Road extends from US 36 to the south of I-70 and is grade-separated via an underpass. Only Manila Road and Imboden Road will provide access routes for the development of the first two parcels.

-  = Paved Roadway
-  = Gravel Roadway
-  = Posted Speed Limit

NORTH

FIGURE 2

Surrounding Roadway Characteristics

48th and 56th Avenues

48th and 56th Avenues have an east/west orientation and are separated by a 1-mile distance. 48th Avenue is paved between Imboden and Manila Roads. Most of 48th Avenue in the vicinity of the project is two lanes wide; however, to the west of Imboden Road, it is an unimproved one-lane roadway that provides access only to a private residence.

56th Avenue is a two-lane roadway that extends westward from Imboden Road towards the City and County of Denver, while to the east of Imboden Road, it exists for only an approximate 1-mile distance along the northern boundary of the Space Port. 56th Avenue is two lanes wide and its alignment to the east of Imboden Road is gravel.

II.C. Rail Facility

The UPRR parallels the northern boundary of US 36. The UPRR trackage extends from the Denver metropolitan area to the east into Kansas and points beyond. There is only one track within the railroad right-of-way, and approximately three trains use this track each day.

II.D. Traffic Volumes

Existing traffic volumes were recorded at intersections critical to the development of the first two parcels, including the two interchange ramp terminals with I-70 at Manila Road. These movements were recorded during the AM and PM peak hours, the typical time periods when vehicle activity is greatest. As shown on **Figure 3**, vehicle movements at these intersections and at the interchange ramp terminals are relatively low when compared to traffic volume levels in other parts of the Denver metropolitan area. All left, through, and right turn movements are less than 120 vehicles per hour (vph), with only a few movements greater than 100 vph.

Daily traffic volumes were also recorded. These measurements include the level of vehicle activity on a roadway for a 24-hour period. Referring to **Figure 3**, it can be seen that daily traffic volume levels along Manila Road are about 300 vpd, while US 36 traffic volumes are about 1,600 vpd and traffic volume along I-70 is 23,000 vpd adjacent to the site. Daily traffic volumes along I-70 and US 36 were acquired from CDOT's Online Transportation Information System (OTIS). **Appendix A** includes the recorded traffic volume data.

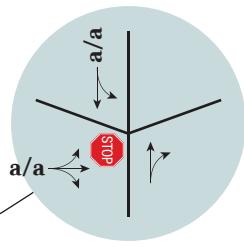

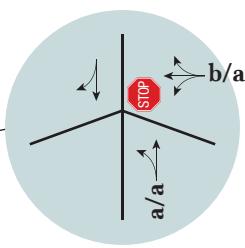

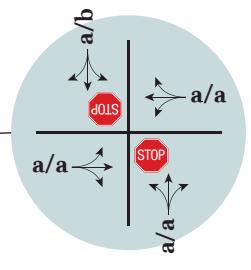

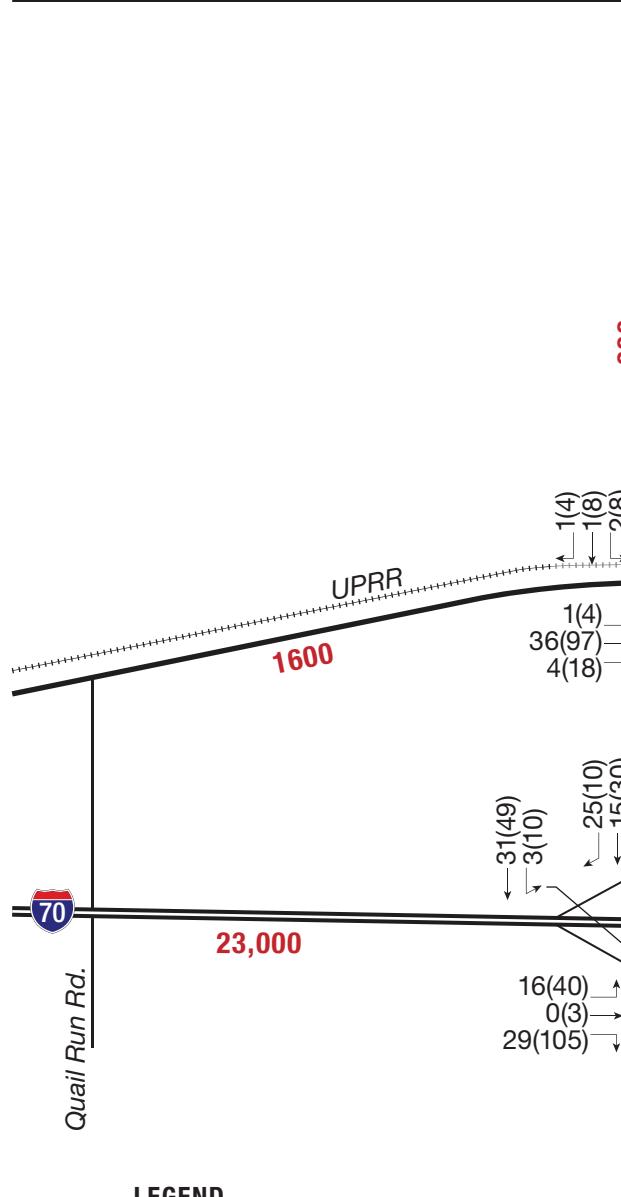

II.E. Traffic Control

Control of vehicle movements at intersections is carried out via stop signs. All stop signs are used on the "minor" street intersection or ramp terminal approaches where vehicle right-of-way assignment is necessary.

II.F. Traffic Operations

Traffic operations were evaluated according to techniques documented in the *Highway Capacity Manual*, 6th Edition (Transportation Research Board, 2016) using the existing traffic volumes, intersection geometry, and traffic control. For stop-controlled intersections, level of service (LOS) is calculated for each vehicle movement that must yield the right-of-way to an oncoming or crossing vehicle. In urbanized areas, LOS D is typically considered to be acceptable for peak hour traffic operations.

Figure 3 also shows the existing traffic control, intersection geometry, and results of the LOS analyses. **Appendix B** includes the LOS criteria, and **Appendix C** includes the analysis worksheets. All intersections currently operate within acceptable parameters, at LOS B or better, during peak hours.

NORTH

FIGURE 3
Existing
Traffic Conditions

III. BACKGROUND CONDITIONS

III.A. Background Traffic Volumes and Intersection Operations

Years 2025 & 2040

Background traffic volume projections for these time periods are based on two data sources and they start with information contained in the DRCOG 2040 travel demand model to understand yearly growth rates. This resource found that existing traffic volumes are projected to grow about 5% annually for a total growth of about 40% by the Year 2025 and approximately 190% by the Year 2040.

Additionally, it is understood that a new development is underway adjacent to Petterson Road. This project is called the Rocky Mountain Rail Park (RMRP) and it will include rail served parcels on the north side of US 36, with a separate parcel on the south side of US 36 that will house a paving operation plant.

Considering these two sources, the traffic volumes represented on **Figures 4** and **5** contain projected background traffic volumes levels for the years 2025 and 2040, respectively, without the development of the two TransPort Colorado parcels, and they include recommended traffic control, intersection geometry, and results of the LOS analyses.

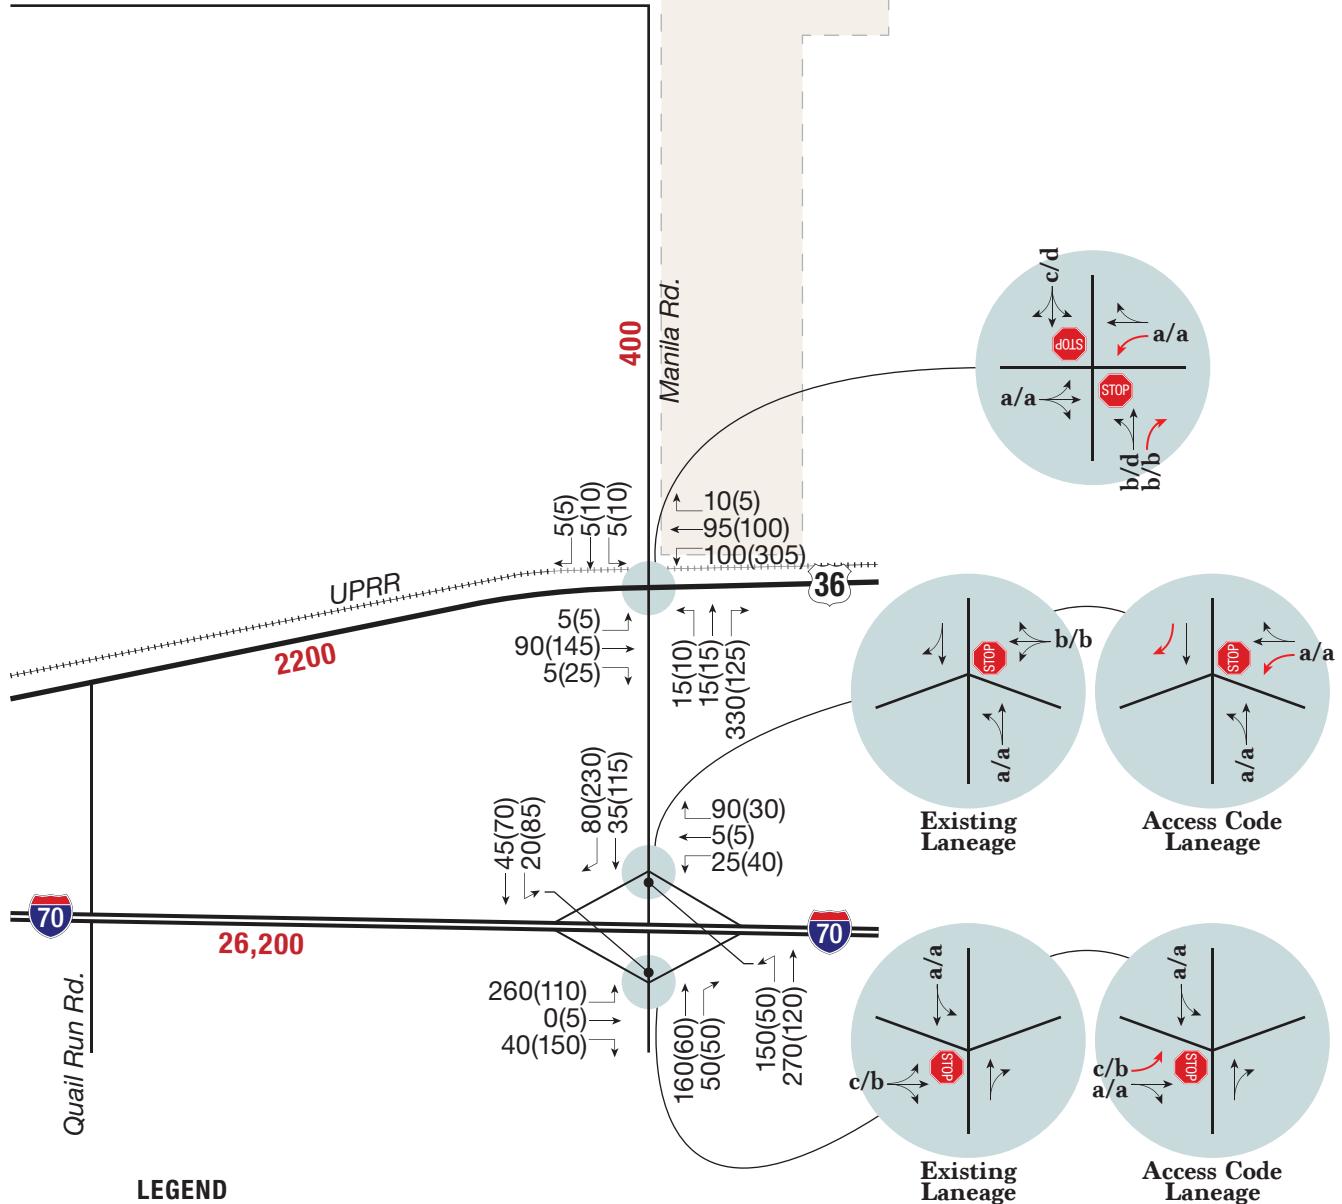

As can be seen from this information, there are certain movements that become relatively sizable, primarily related to the development of the Rocky Mountain Rail Park. For example, the northbound right turn and westbound left turn at the US 36/Manila Road intersection reach 300 vehicles per hour (vph) during the peak hours, while the eastbound left turn and southbound right turn at the I-70 interchange are also quite high. When compared to existing traffic volumes, and considering the percentage growth rates, most of the traffic volume increases can be attributable to the construction of the Rocky Mountain Rail Park.

Increases in background traffic require a number of identified improvements when using the State Highway Access Code (the Code) criteria as a guide (refer to **Figures 4** and **5** also):

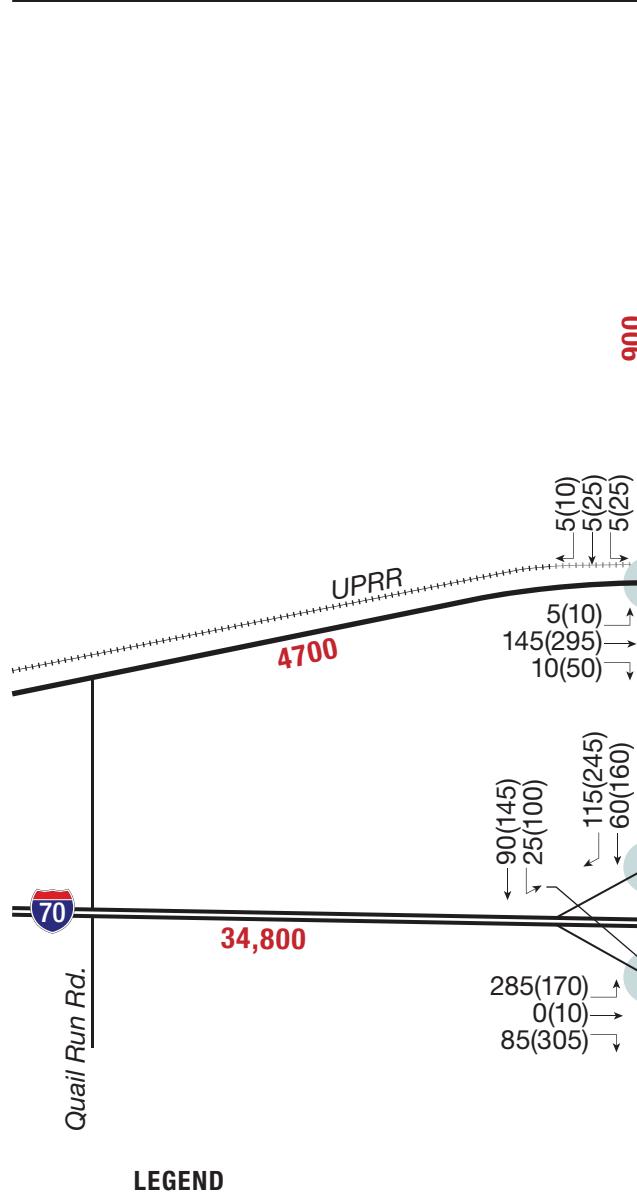

- Westbound left turn lane and northbound right turn lane at the US36/Manila Road intersection (2025; primarily related to the development of the Rocky Mountain Rail Park)
- Southbound left turn lane at the US36/Manila Road intersection (2040 only)
- Eastbound right turn lane at the US36/Manila Road intersection (2040 only)
- Southbound right turn lane and westbound left turn lane at the I-70 Westbound Exit Ramp/Manila Road intersection (2025)
- Eastbound left turn lane at the I-70 Eastbound Exit Ramp/Manila Road intersection (2025)

It should be noted, however, that the laneage improvements at the I-70 ramp terminals along Manila Road identified for 2025 are not required due to intersection operations – they are only required based on the minimum traffic volume thresholds of the Code. As can be seen on **Figure 4**, peak hour LOS results both with and without these additional lanes are very comparable. As such, and recognizing that additional sites in TransPort Colorado or at other nearby parcels are likely to develop by 2025, it is suggested that these improvements can be deferred to a future timeframe until operational conditions dictate.

Analysis worksheets for both year 2025 and 2040 background conditions are included in **Appendix E**.

NOTE:
See Section III.A. for Operational Discussion

NOTE:
See Section III.A. for Operational Discussion

Relative to operations in the year 2040, even with the above identified improvements, the following movements may operate at LOS E or F during the peak hours with only background traffic volumes:

- Southbound left turn at the US36/Manila Road intersection – LOS E during the AM peak hour and LOS F during the PM peak hour
- Southbound through/right movements at the US36/Manila Road intersection – LOS E during the PM peak hour
- Northbound through/left movement at the US36/Manila Road intersection – LOS F during the PM peak hour
- Westbound left turn at the I-70 Westbound Exit Ramp/Manila Road intersection – LOS E during the PM peak hour

Regardless of these operational conditions, none of the three intersections along Manila Road are projected to meet traffic signalization warrants as defined by the *Manual On Uniform Traffic Control Devices* (MUTCD) under background conditions. Peak hour signalization warrants for background conditions have been included in **Appendix D**. While analyzed for the purposes of completeness in this report, the year 2040 analyses do not take into account the current CDOT system level feasibility study for this area of I-70. That study is in its early stages and no recommendations are available at this time. As that report develops, it will consider TransPort Colorado impacts along with other nearby develop to assist in making decisions related to roadway and interchange recommendations.

IV. ISP I DEVELOPMENT CONDITIONS

This section summarizes the land use information, traffic volume projections, and operational analyses for the development of the proposed transload facility and a 414,000sf warehouse.

IV.A. ISP I Land Uses

Two parcels are currently being planned for this ISP I submittal. The transload facility will occupy approximately 76 acres on which there will be several rail track alignments to manage freight deliveries. Space will be provided for certain transload operations where materials will be stored on-site for pick-up or drop-off by local businesses. The transload site will be the starting point for future short-track delivery of materials to several industrial parcels in TransPort Colorado. Besides the rail track alignments, only a small amount of office space for employees will be provided (1,500 – 2,000sf).

The warehouse site is planned for 288,000sf of building on approximately 40 acres. Office space, inside storage and loading docks, along with outdoor storage will be available.

Figures 6 & 7 represent the proposed site plans for these two sites. Access for both sites will be along 32nd Avenue which is a new street in the City of Aurora. This street will extend between Manila and Imboden Roads, and both sites will be along the south side of this street. Access for the transload facility will be located at the approximate alignment of an extension of Cavanaugh Road, while access for the warehouse is to the west of a new drainage channel adjacent to Manila Road.

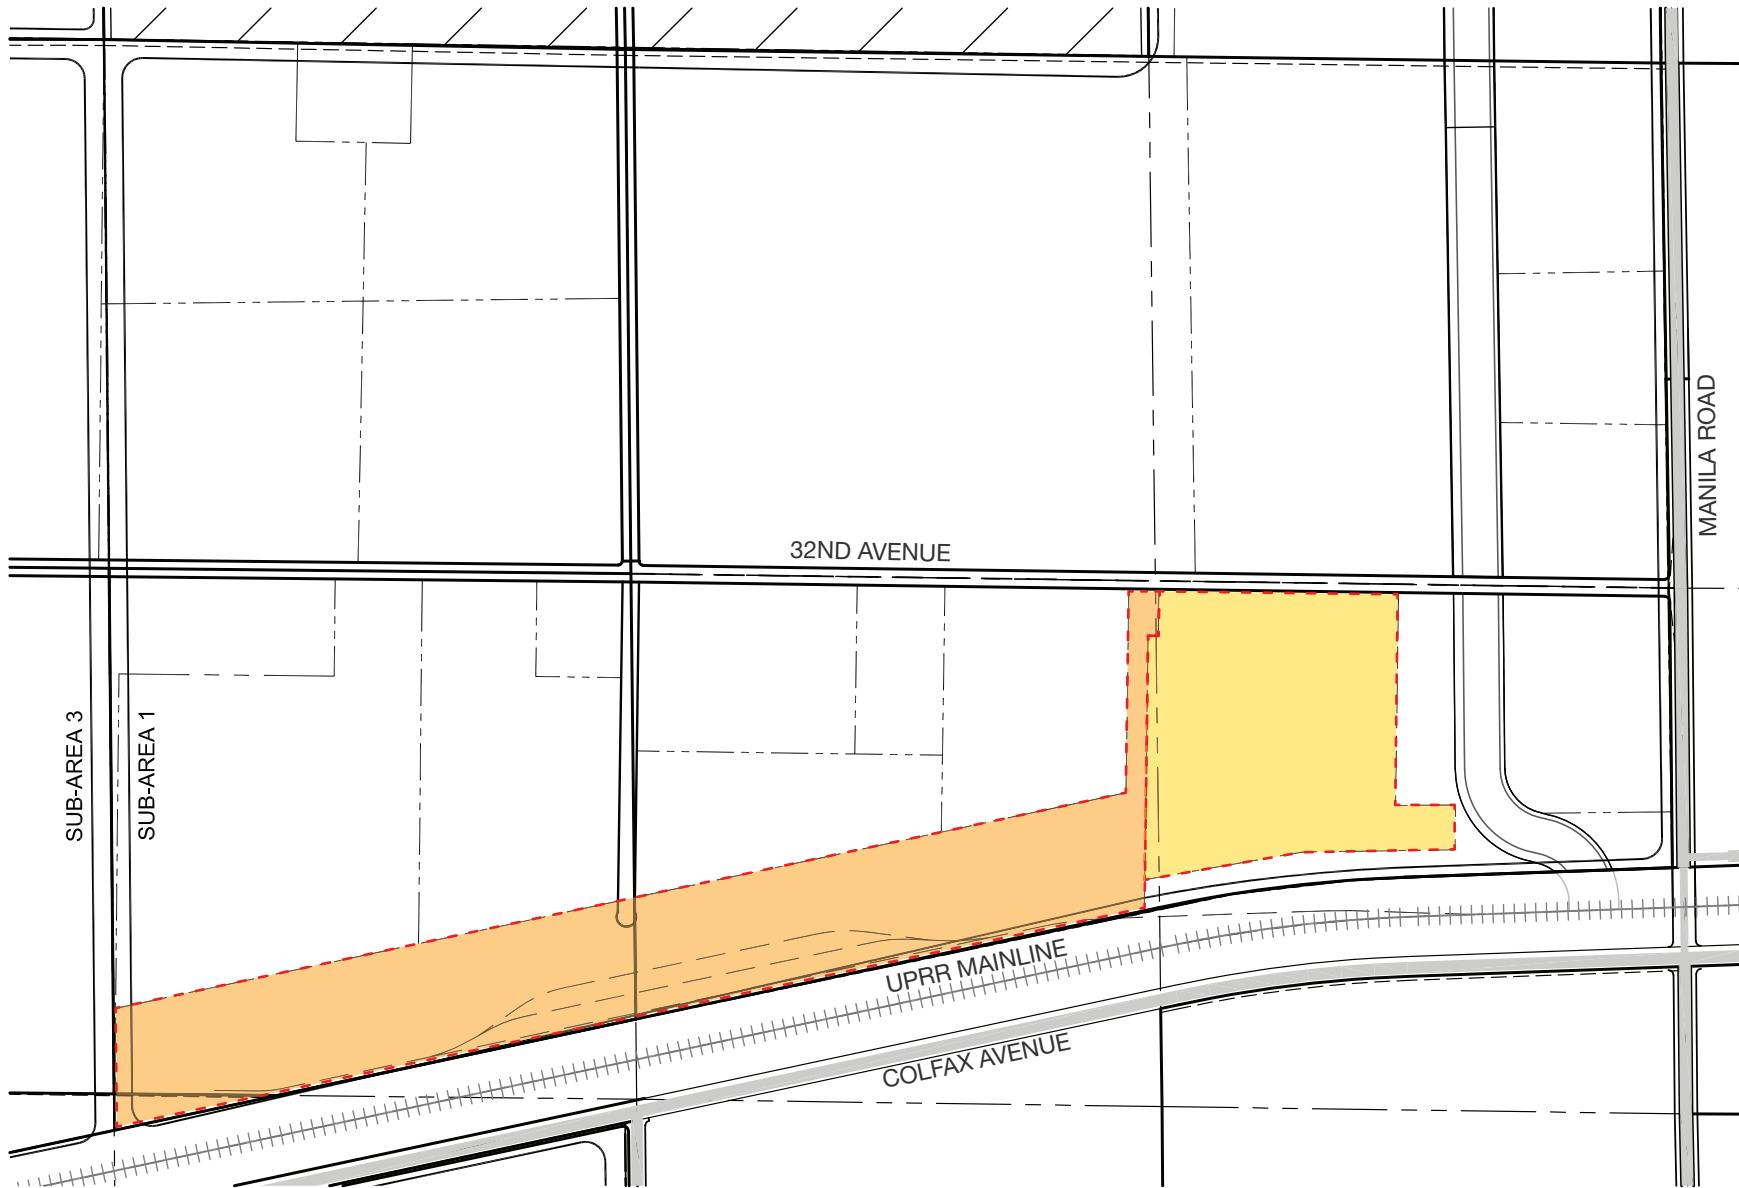

IV.B. Trip Generation Estimates

Table I includes the trip generation estimates for the two development sites. Estimates for the transload facility are based on operational discussions with its owners, Alpenglow Rail. Those discussions found that an average of six rail cars will be delivered to the site each day. Some of those rail cars will be shipped directly to future warehouse sites, while others will be unloaded on-site for pick-up by delivery trucks. Each rail car requires only two semi-trucks for deliveries. Only three employees will work at the site during a normal weekday schedule.

Estimates for the warehouse site use the Light Industrial trip generation category contained in *Trip Generation, 10th Edition*, by the Institute of Transportation Engineers (ITE), 2017 to be consistent with previous analyses for the TransPort Colorado FDP submittal. The site has a total of four driveways; two for employee/customer use and two for delivery use. The delivery path is one way with trucks entering on the east and exiting on the west side of the site.

Table I. ISP I Trip Generation Estimates

Land Use	Acres (±)	Building Square Footage (ksf)	Daily Vehicle- Trips	AM Peak Hour			PM Peak Hour			
				In	Out	Total	In	Out	Total	
Transload Facility	76	1.5-2.0	35	4	1	5	1	4	5	
Warehouse	40	288	1,149	86	12	98	10	67	77	
TOTALS =				1,184	90	13	103	11	71	82

FIGURE 7
Warehouse
Site Plan

IV.C. Trip Distribution & Assignment

Estimates of vehicle routing to/from the transload and warehouse sites were developed based on the location of each site and on the available access routes. **Figure 8** provides a summary of the trip distribution and **Figure 9** depicts the projected site generated traffic volumes. As can be seen on these figures, given the industrial/warehousing nature of these two projects, the projected vehicle trips have a high orientation towards I-70 and particularly towards the west to/from the Denver metropolitan area. It can also be seen that the largest vehicle levels are less than 70 (northbound across US 36), along with the left turn and right turn movements at the eastbound and westbound I-70 ramp terminals.

IV.D. 2025 Total Traffic Volumes

Figure 10 represents the combination of projected 2025 background traffic volumes from **Figure 4** along with the estimated site generated volumes from **Figure 9**. As you can see from this information, certain intersection movements reach levels around 300 vehicle trips during the AM and PM peak hours:

- US 36 westbound left turn at Manila Road (305 in the PM peak hour) (primarily related to the RMRP)
- Northbound Manila Road right turn at US 36 (330 in the AM peak hour) (primarily related to the RMRP)
- Southbound right turn on Manila Road at the westbound I-70 ramp terminal (272 in the PM peak hour)
- Eastbound left turn onto Manila Road from the eastbound I-70 ramp terminal (312 in the AM peak hour)

The directionality and peak periods for these movements is not surprising, i.e., towards the north and east during the AM peak hour and to/from the south and west during the PM peak hour.

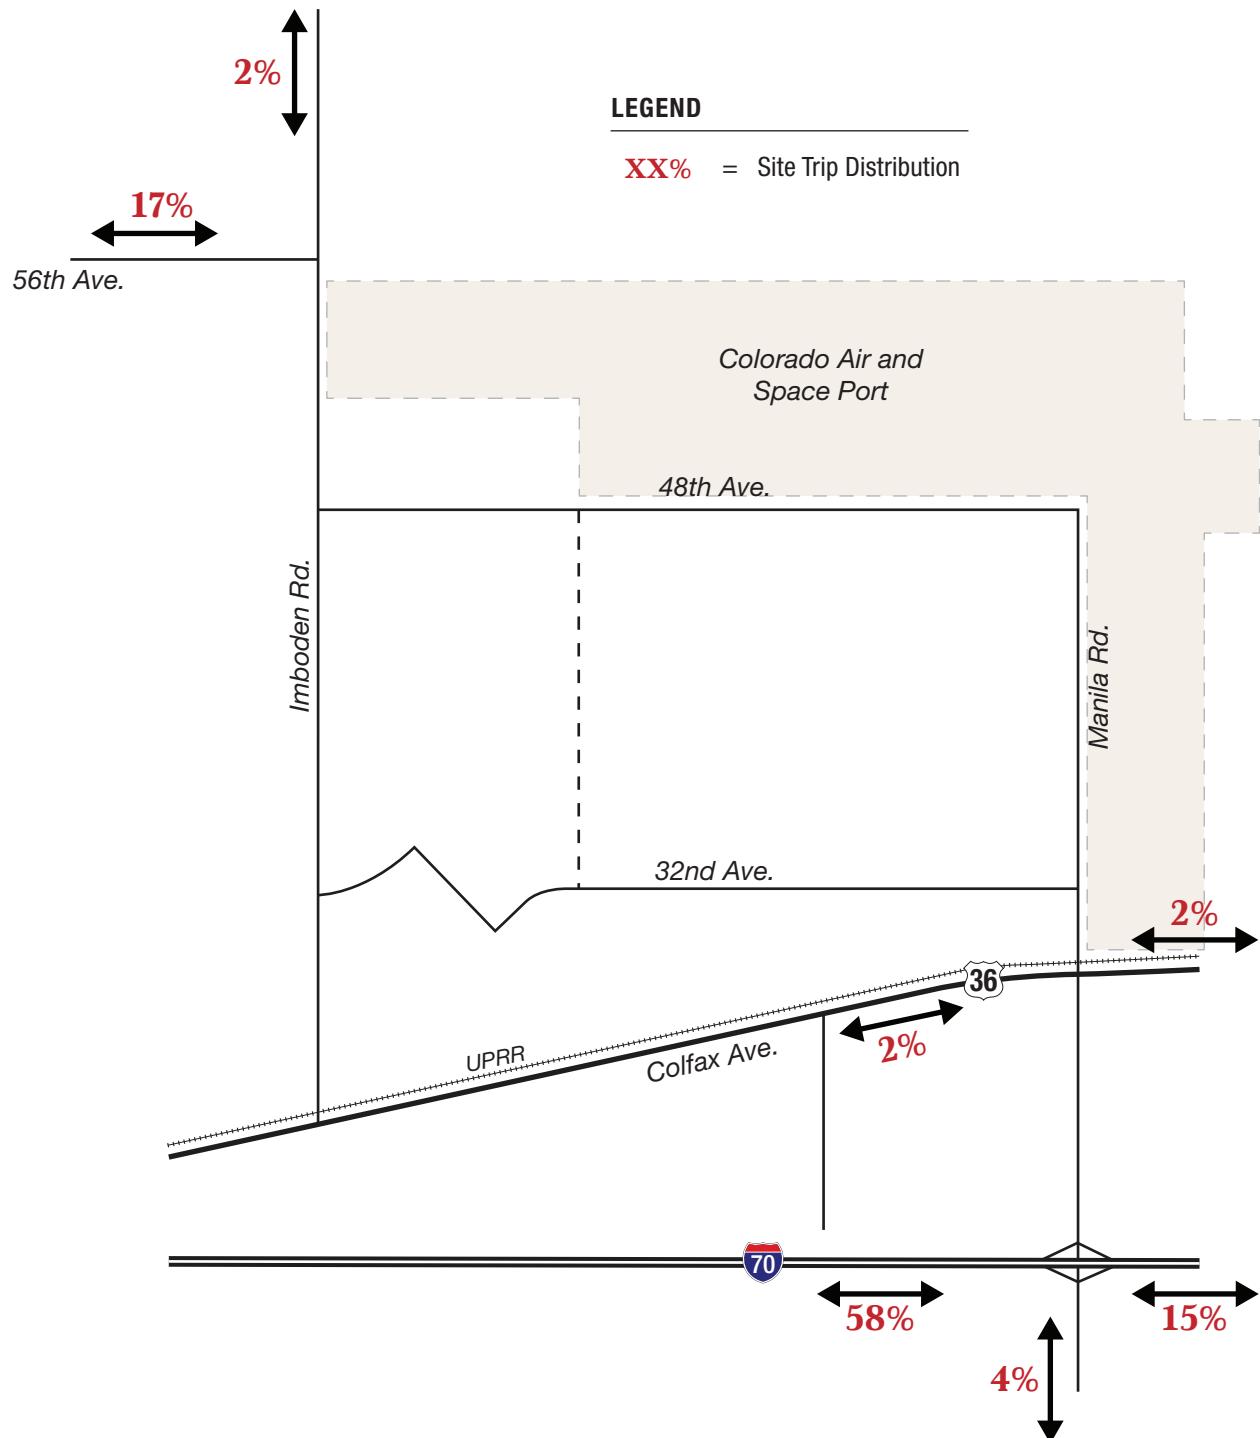

IV.E. 2025 Operational Conditions

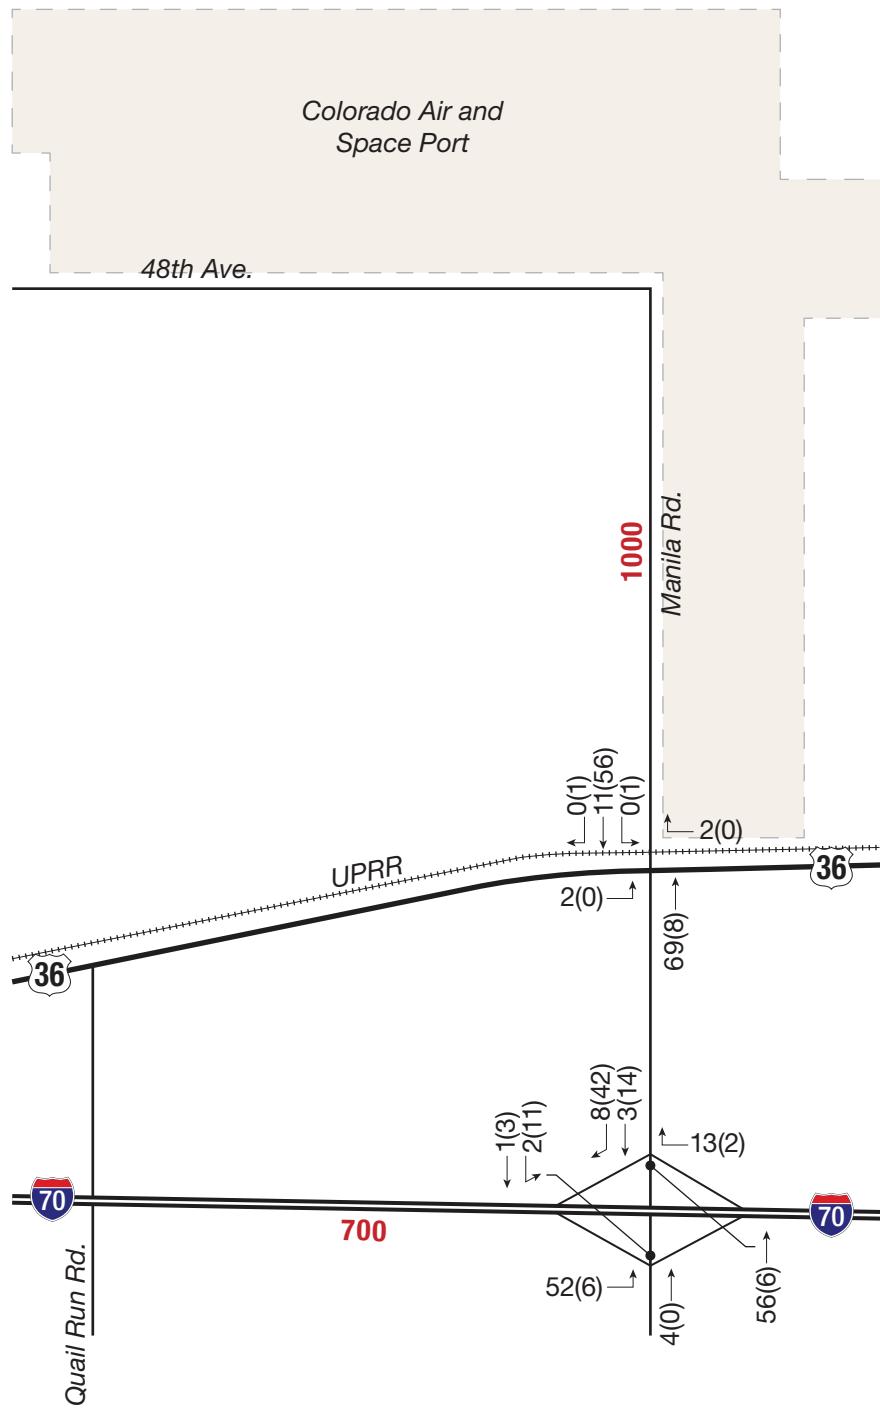

Study area intersections are projected to operate well except for a few vehicle movements:

US 36/Manila Road Intersection – Movements on Manila Road that attempt crossing maneuvers of US 36 are projected to experience sufficient average vehicle delay to result in LOS E during the PM peak hour. While these movements are not excessive, they are impeded by the large number of westbound left turn movements that are mostly attributable to the Rocky Mountain Rail Park. For example, the rail park projects over 300 westbound left turns during the PM peak hour which results in smaller vehicle gaps for northbound and southbound movements to proceed into or across this intersection. Of note, vehicle queuing on the southbound approach is not projected to extend to the UPRR tracks.

Traffic signal warrant analyses (see **Appendix F**) find that this intersection is not projected to meet warrants for traffic signal installation by completion of the first two development parcels. As such, if all of the vehicle-trips associated with the Rocky Mountain Rail Park come to fruition, northbound and southbound motorists will experience a higher level of delay than desired during the PM peak hour.

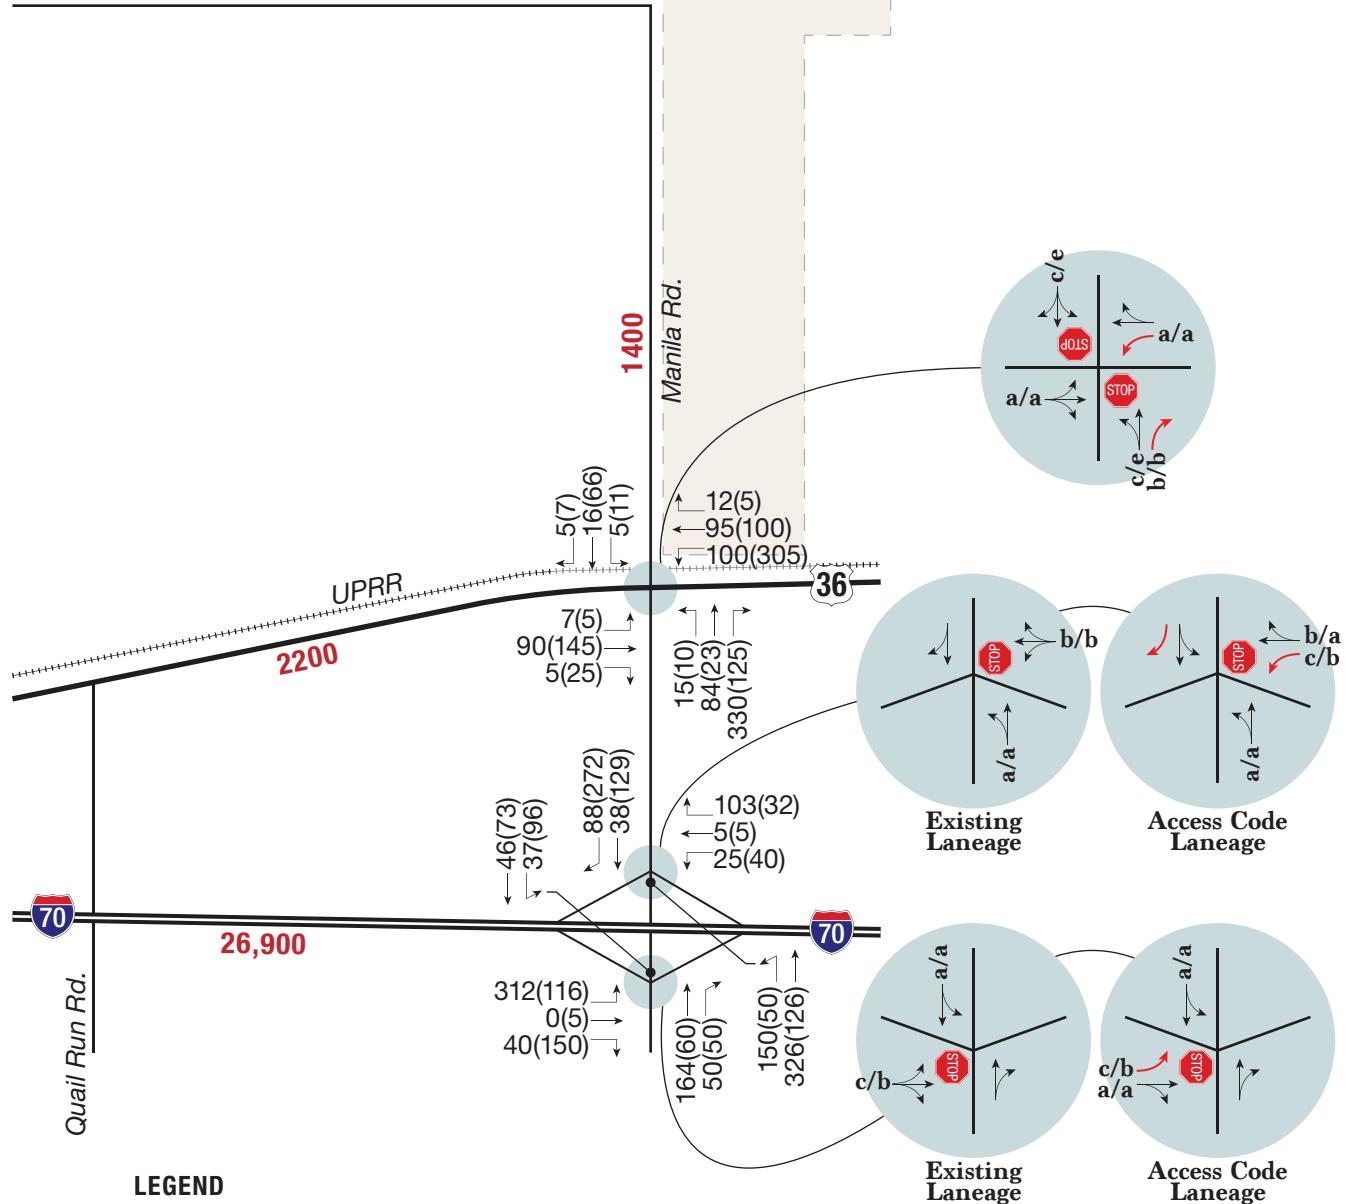

Westbound and Eastbound I-70 Ramp Terminals – While southbound right turn and both the westbound and eastbound left turn lanes have been identified as meeting Code criteria for installation during both the 2025 background and build scenarios, it is believed that those improvements could be deferred until additional development occurs in the area. Similar to background conditions, **Figure 10** finds that there are similar LOS results with or without these improvements (LOS C or better).

LEGEND

- XXX(XXX) = AM(PM) Peak Hour Traffic Volumes
- XXX** = Daily Traffic Volumes

NOTE:
See Section IV.G. for Operational Discussion

IV.F. 2040 Total Traffic Volumes

Figure 11 represents the combination of projected 2040 background traffic volumes from **Figure 5** along with the estimated site generated volumes from **Figure 9**. As you can see from this information, with an additional 15 years of background traffic growth, the same intersection movements continue to be near or above 300 vehicle trips during the AM and PM peak hours:

- US 36 westbound left turn at Manila Road (325 in the PM peak hour)
- Northbound Manila Road right turn at US 36 (345 in the AM peak hour)
- Southbound right turn on Manila Road at the westbound I-70 ramp terminal (287 in the PM peak hour)
- Eastbound left turn onto Manila Road from the eastbound I-70 ramp terminal (337 in the AM peak hour)

IV.G. 2040 Operational Conditions

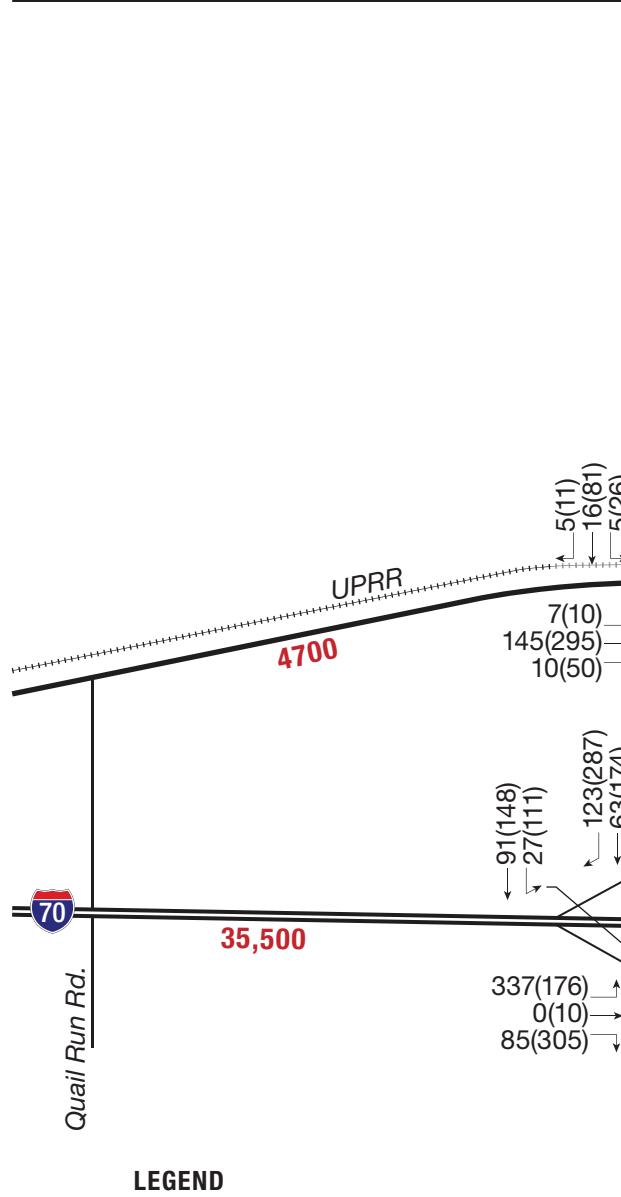

With additional background traffic growth, most study area intersections will continue to operate well except for a few conditions:

US 36/Manila Road Intersection – Two movements on Manila Road that attempt southbound maneuvers at US 36 are projected to experience sufficient average vehicle delay to result in LOS F during the AM and PM peak hours (refer to **Figure 11**). While these movements are not excessive, they will continue to be impeded by the number of westbound left turn movements that are mostly attributable to the Rocky Mountain Rail Park (over 300 left turns during the PM peak hour which result in smaller vehicle gaps).

Traffic signal warrant analyses (see **Appendix F**) continue to find that this intersection is not projected to meet warrants for traffic signal installation by 2040 with only the development of the first two TransPort Colorado parcels. Recognizing that other parcels in TransPort Colorado or general background growth will increase traffic volume levels, it is anticipated that this intersection will meet signalization warrants before the year 2040 timeframe.

Westbound and Eastbound I-70 Ramp Terminals – Similar to the year 2025 timeframe, certain movements will meet Code criteria for installation of additional lanes. And even with these additional lanes, the eastbound left at the eastbound ramp terminal is projected to operate at LOS E and the westbound left at the westbound ramp terminal is projected to operate at LOS F during the AM peak hour. **Figure 11** represents those additional lanes and the operational conditions. These intersections are not projected to meet warrants for the installation of a traffic signal, however, during this timeframe with only the known development. Each of these intersection will need to be monitored periodically to understand when traffic signals or another traffic control method should be installed as additional parcels in TransPort Colorado or in other areas result in increased traffic volumes at these intersections.

Analysis worksheets are contained in **Appendix G**.

LEGEND

- XXX(XXX) = AM(PM) Peak Hour Traffic Volumes
- XXXX** = Daily Traffic Volumes
- x/x = AM/PM Peak Hour Unsignalized Intersection Level of Service
- ↖ = Lane Improvement
- STOP = Stop Sign

NOTE:
See Section IV.G. for Operational Discussion

IV.H. Recommended Roadway Laneage

As can be seen on **Figures 10** and **11**, intersection geometry is the same regardless of the development timeframe, with the exception of the addition of a southbound left turn lane at the intersection of US 36 and Manila Road by year 2040. It is recommended, however, that improvements at the I-70 ramp terminals along Manilla Road be deferred until further development occurs since the operational analyses show that each intersection will operate well except the southbound Manila Road movements at US 36. Through laneage requirements can remain as what exists today since the two development sites do not add much traffic to the overall street network. Manila Road can remain as a two-lane facility.

IV.I. Auxiliary Lane Recommendations

Projected traffic volumes along with the estimated intersection operational analyses were used to recommend the type and dimensional characteristics for each auxiliary lane that is needed for each intersection to function appropriately by the year 2040 timeframe; no auxiliary lanes are recommended for year 2025. Vehicle storage length considers the influence of semi-truck vehicles in these estimates. **Table 2** includes auxiliary lane dimensions for the study area intersections using *Code* criteria.

Table 2. 2040 Auxiliary Lane Recommendations

Intersection	Auxiliary Lane Type	Direction	Posted Speed (mph)	Deceleration Length	Vehicle Storage	Taper ¹
US 36/Manila Road	Left Turn	Westbound ²	55	600'	475 ³	222'
		Southbound	Assumed 45	435'	50'	162'
	Right Turn	Northbound	Assumed 45	435'	NA	162'
Westbound I-70 Ramp Terminal	Right Turn	Southbound	Assumed 45	435'	NA	162'
	Left Turn ⁴	Westbound	45	435'	125 ³	162'
Eastbound I-70 Ramp Terminal	Left Turn ⁴	Eastbound	45	435'	475 ³	162'

¹ Taper length included in the deceleration lane length. Dimension is for a 12' wide lane.

² Constructed by the Rocky Mountain Rail Park.

³ Includes the influence of semi-truck vehicles.

⁴ Ramps have sufficient existing upstream deceleration length.

V. SUMMARY AND RECOMMENDATIONS

TransPort Colorado, a multi-year master-planned business environment in the City of Aurora, is planning to construct the first two parcels of its overall development area. These two parcels will include a 288,000 square foot (sf) warehouse along with a rail transload facility that will eventually provide short-line rail access for numerous TransPort Colorado parcels.

The first two parcels will be located along 32nd Avenue in the City of Aurora near Manila Road in the approximate southeast quadrant of TransPort Colorado. Given the industrial/warehousing nature of these sites, the primary access route will be along Manila Road to/from the I-70/Manila Road interchange.

Trip generation for the two development sites is projected to be 1,183 on a daily basis, with 103 trips during the AM peak hour and 82 during the PM peak hour. These levels are relatively low trip generation levels given the amount of acreage that the two parcels cover – not unexpected for these types of land uses, however.

When considering these trip generation levels and the projected operational analyses, ISP I can be constructed without roadway improvements at the three CDOT intersections included in this report. It is recognized that other parcels within and outside of the TransPort Colorado boundary will likely require additional laneage and traffic control improvements, none are recommended for the development of the first two parcels.

A sensitivity analysis of operational conditions has been performed to determine that approximately 1,000 KSF of additional light industrial development can occur prior to the need for additional auxiliary lanes or traffic control improvements.

APPENDIX B. LEVEL OF SERVICE CRITERIA

TABLE B1
LEVEL OF SERVICE CRITERIA FOR
TWO-WAY STOP CONTROLLED (TWSC) INTERSECTIONS AND ROUNDABOUTS

Level of Service	Delay Range (sec/veh)
A	0.0 – 10.0
B	>10.0 – 15.0
C	>15.0 – 25.0
D	>25.0 – 35.0
E	>35.0 – 50.0
F	> 50.0

Adapted from *Highway Capacity Manual*, Transportation Research Board, 2010.

TABLE B2
LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

Level of Service	Control Delay (sec/veh)	Qualitative Description
A	≤ 10.0	Good progression, short cycles, very few vehicle-stops.
B	>10.0 – 20.0	Good progression, and/or short cycle lengths, more vehicle-stops.
C	>20.0 – 35.0	Fair progression and/or longer cycle lengths, some individual cycle failures, many vehicle-stops
D	>35.0 – 55.0	Noticeable congestion and cycle failures, unfavorable progression, high v/c ratios, several stops.
E	>55.0 – 80.0	Limit of acceptable delay, poor progression, long cycles, high v/c ratios, frequent cycle failures.
F	> 80.0	Delay is unacceptable to most drivers, volume exceeds capacity, breakdown of traffic flow.

Adapted from *Highway Capacity Manual*, Transportation Research Board, 2010.

I. INTRODUCTION

TransPort Colorado, a multi-year master-planned business environment in the City of Aurora, is planning to construct the first two parcels of its overall development area. These two parcels will include a 288,000 square foot (sf) warehouse along with a rail transload facility that will eventually provide short-line rail access for numerous TransPort Colorado warehouse and industrial parcels. Originally, the transload facility will provide rail delivery of goods and materials to the proposed warehouse.

These first two parcels will be located along 32nd Avenue near Manila Road in the approximate southeast quadrant of TransPort Colorado. Given the industrial/warehousing nature of these sites, the primary access route will be along Manila Road to/from the I-70/Manila Road interchange, while secondary access will be provided to/from the west via 32nd Avenue and Imboden Road. **Figure I** provides a vicinity map of the two site locations.

The components of this Traffic Impact Analysis (TIA) are based on information contained in the summary of the pre-application meeting notes along with follow-up discussions with City of Aurora staff. This report provides an assessment of the traffic impacts related to the development of the first two parcels and it includes estimates of traffic growth not related to TransPort Colorado, particularly the Rocky Mountain Rail Park and its influence at Colorado Department of Transportation (CDOT) managed intersections.

Specific elements of this report include:

- Evaluation of existing operational conditions
- Background traffic projections for the Years 2025 and 2040
- Trip generation estimates for the proposed land uses
- Analysis of project impacts
- Traffic signalization warrant information
- Discussion on pedestrian connectivity
- Recommendations for public improvements

Of note, this report includes information on an alternative access route via 32nd Avenue and Quail Run Drive which identifies travel conditions for this route if the 32nd Avenue to Imboden Road route is not available (more in Section IV.C.).

Map

II. EXISTING CONDITIONS

II.A. Land Use

The land areas near the first two parcels are largely undeveloped with the exception of the Colorado Air and Space Port (Space Port) to the north and some single-family homes along the south side of US 36 adjacent Petterson Road. Residential and commercial uses exist in the Towns of Watkins and Bennett along with small residential enclaves somewhat distant from the project site.

II.B. Roadway System

Several existing roadways are spaced along 1-mile land sections, although most of these roads currently have very little traffic and are somewhat discontinuous. One interstate highway and one United States highway will provide access routes for the first two parcels. **Figure 2** provides a representation of the surrounding roadway network, its laneage, and its speed limit characteristics. Following are more detailed descriptions of the primary roadways adjacent and near the project site.

Interstate 70 (I-70)

I-70 is a major interstate route that bisects the State of Colorado at its approximate north/south midpoint. Not only is this route the primary east/west corridor for interstate travel in Colorado, but this route provides access to numerous states outside Colorado, from Utah to Maryland. I-70 has four travel lanes for vehicle movements and is posted with a speed limit of 75 miles per hour (MPH).

There are two interchanges with I-70 near the project site. The Manila Road interchange is near the midpoint of TransPort Colorado and is proposed to be one of the primary interstate access routes for the TransPort Colorado land uses, including the first two parcels. Four miles to the west of the Manila Road interchange is the Watkins Road interchange.

United States 36 (US 36)

US 36 traverses the project area in an east/west alignment and it is directly adjacent to Union Pacific Railroad (UPRR) trackage that will provide rail access for the transload facility. The centerline-to-centerline distance between these two facilities is approximately 250 feet. US 36 is two lanes wide and it has a posted speed limit of 55 MPH. Several section line roadways intersect US 36, and each intersecting roadway is controlled by stop signs at US 36. CDOT classifies US 36 as a Rural Highway (R-B) in this area.

Imboden, Quail Run, Cavanaugh, Manila, Petterson, and Schumaker Roads

Each of these roadways exists at 1-mile intervals adjacent, within, or near TransPort Colorado, with each having a north/south orientation. Only Imboden and Petterson Roads are continuous for any significant distance adjacent to TransPort Colorado, however. Both of these roadways extend from US 36 to the north past the TransPort Colorado boundary. Quail Run Road extends from US 36 to the south of I-70 and is grade-separated via an underpass. Only Manila Road and Imboden Road will provide access routes for the development of the first two parcels.

LEGEND

-  = Number of Through Lanes
-  = Paved Roadway
-  = Gravel Roadway
-  = Posted Speed Limit

NORTH

FIGURE 2

Surrounding Roadway Characteristics

48th and 56th Avenues

48th and 56th Avenues have an east/west orientation and are separated by a 1-mile distance. 48th Avenue is paved between Imboden and Manila Roads. Most of 48th Avenue in the vicinity of the project is two lanes wide; however, to the west of Imboden Road, it is an unimproved one-lane roadway that provides access only to a private residence.

56th Avenue is a two-lane roadway that extends westward from Imboden Road towards the City and County of Denver, while to the east of Imboden Road, it exists for only an approximate 1-mile distance along the northern boundary of the Space Port. 56th Avenue is two lanes wide and its alignment to the east of Imboden Road is gravel.

II.C. Rail Facility

The UPRR parallels the northern boundary of US 36. The UPRR trackage extends from the Denver metropolitan area to the east into Kansas and points beyond. There is only one track within the railroad right-of-way, and approximately three trains use this track each day.

II.D. Traffic Volumes

Existing traffic volumes were recorded at intersections critical to the development of the first two parcels, including the two interchange ramp terminals with I-70 at Manila Road. These movements were recorded during the AM and PM peak hours, the typical time periods when vehicle activity is greatest. As shown on **Figure 3**, vehicle movements at these intersections and at the interchange ramp terminals are relatively low when compared to traffic volume levels in other parts of the Denver metropolitan area. All left, through, and right turn movements are less than 120 vehicles per hour (vph), with only a few movements greater than 100 vph.

Daily traffic volumes were also recorded. These measurements include the level of vehicle activity on a roadway for a 24-hour period. Referring to **Figure 3**, it can be seen that daily traffic volume levels along Imboden Road are about 2,400 vehicles per day (vpd), while along Manila Road, the level is only about 300 vpd. US 36 traffic volumes are about 1,600 vpd, and traffic volume along I-70 is 23,000 vpd adjacent to the site. Daily traffic volumes along I-70 and US 36 were acquired from CDOT's Online Transportation Information System (OTIS). **Appendix A** includes the recorded traffic volume data.

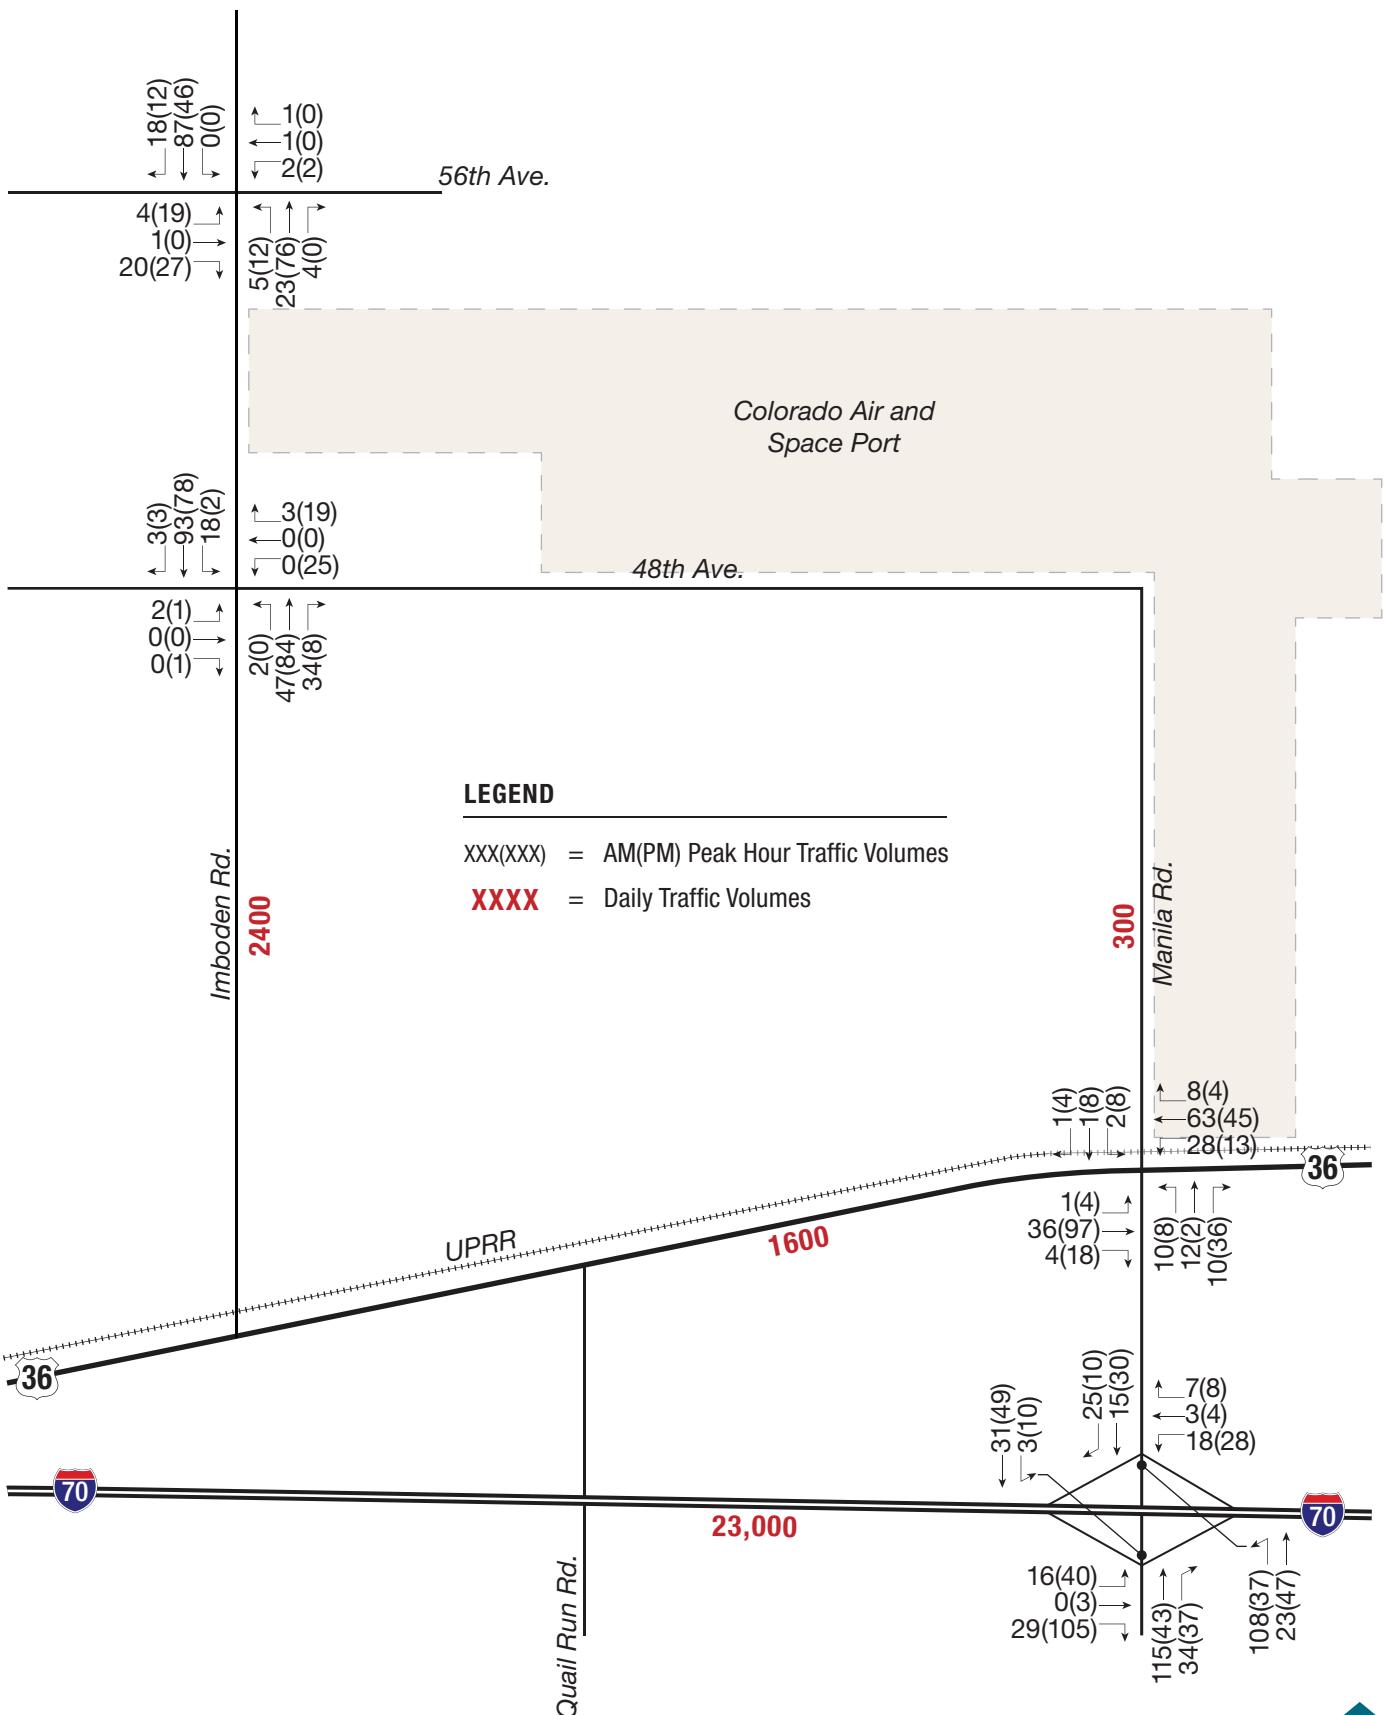

II.E. Traffic Control

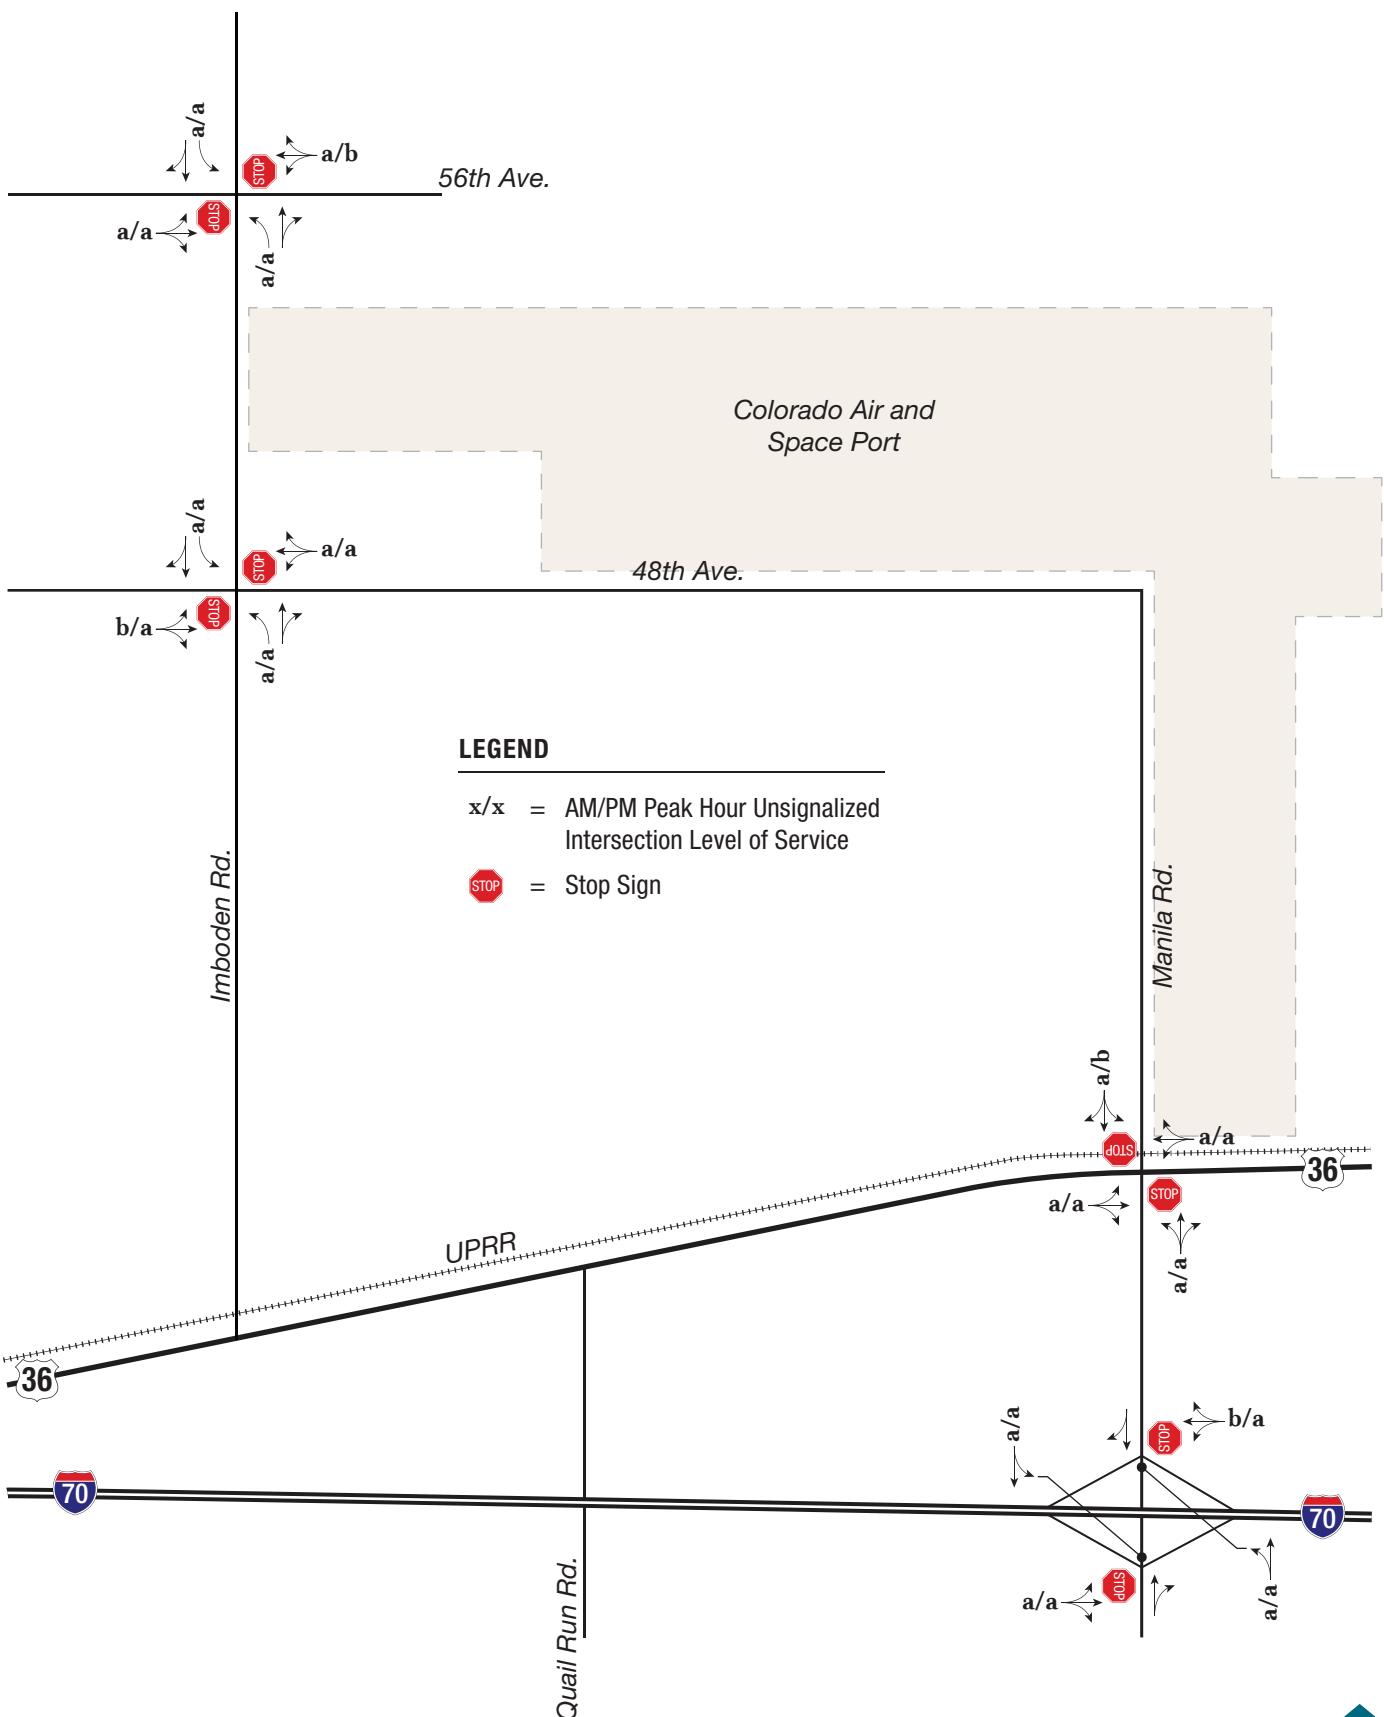

Control of vehicle movements at intersections is carried out via stop signs. All stop signs are used on the “minor” street intersection or ramp terminal approaches where vehicle right-of-way assignment is necessary.

II.F. Traffic Operations

Traffic operations were evaluated according to techniques documented in the *Highway Capacity Manual*, 6th Edition (Transportation Research Board, 2016) using the existing traffic volumes, intersection geometry, and traffic control. For stop-controlled intersections, level of service (LOS) is calculated for each vehicle movement that must yield the right-of-way to an oncoming or crossing vehicle. In urbanized areas, LOS D is typically considered to be acceptable for peak hour traffic operations and it is the standard set in the City of Aurora traffic impact study guidelines.

Figure 4 shows the existing traffic control, intersection geometry, and results of the LOS analyses. **Appendix B** includes the LOS criteria, and **Appendix C** includes the analysis worksheets. All intersections currently operate within acceptable parameters, at LOS B or better, during peak hours.

III. BACKGROUND CONDITIONS

III.A. Roadway Network Plan

The Northeast Area Transportation Study Refresh (NEATS Refresh) was updated for the City of Aurora in October 2018. This publication summarized the build-out transportation recommendations for the NEATS Refresh planning area for the roadway, transit and trail systems. The boundary for this study effort was approximately between Picadilly Road on the west, Schumaker Road on the east, Jewell Avenue on the south, and 72nd Avenue on the north.

While the first two parcels of TransPort Colorado are within the NEATS Refresh boundary, major roadway improvements are not expected for only the impacts related to these two parcels. Regardless, NEATS Refresh identified the future classifications of nearby roadways that will provide access for the first two parcels, being Major Arterials along Manila Road, 48th Avenue and 56th Avenue.

III.B. Background Traffic Volumes and Intersection Operations

Year 2025

Background traffic volume projections for this time period are based on two data sources and they start with information contained in NEATS Refresh to understand yearly growth rates. This resource found that existing traffic volumes are projected to grow about 6.4 % annually for a total growth of approximately 55% by the Year 2025.

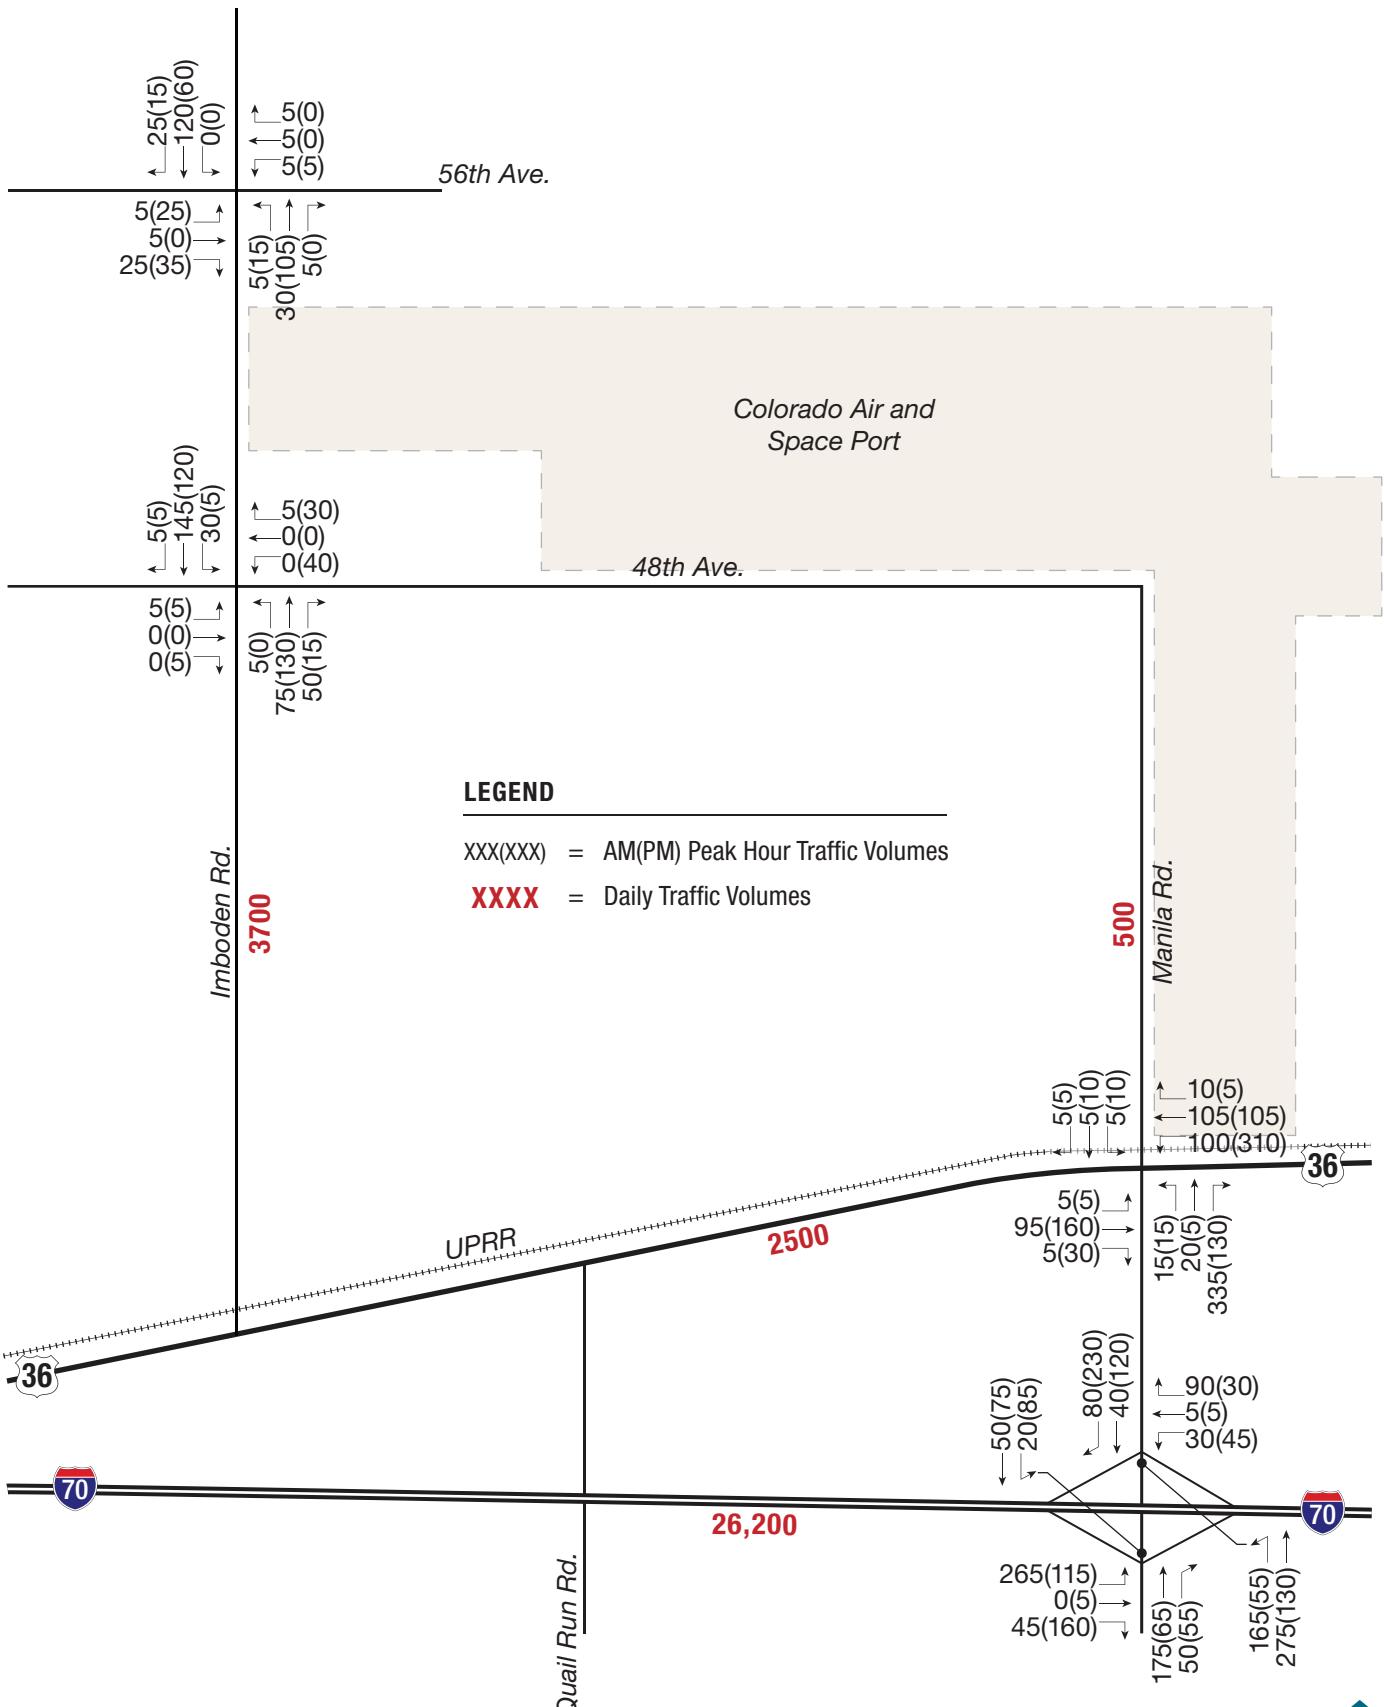

Additionally, it is understood that a new development is underway adjacent to Petterson Road. This project is called the Rocky Mountain Rail Park (RMRP) and it will include rail served parcels on the north side of US 36, with a separate parcel on the south side of US 36 that will house a paving operation plant.

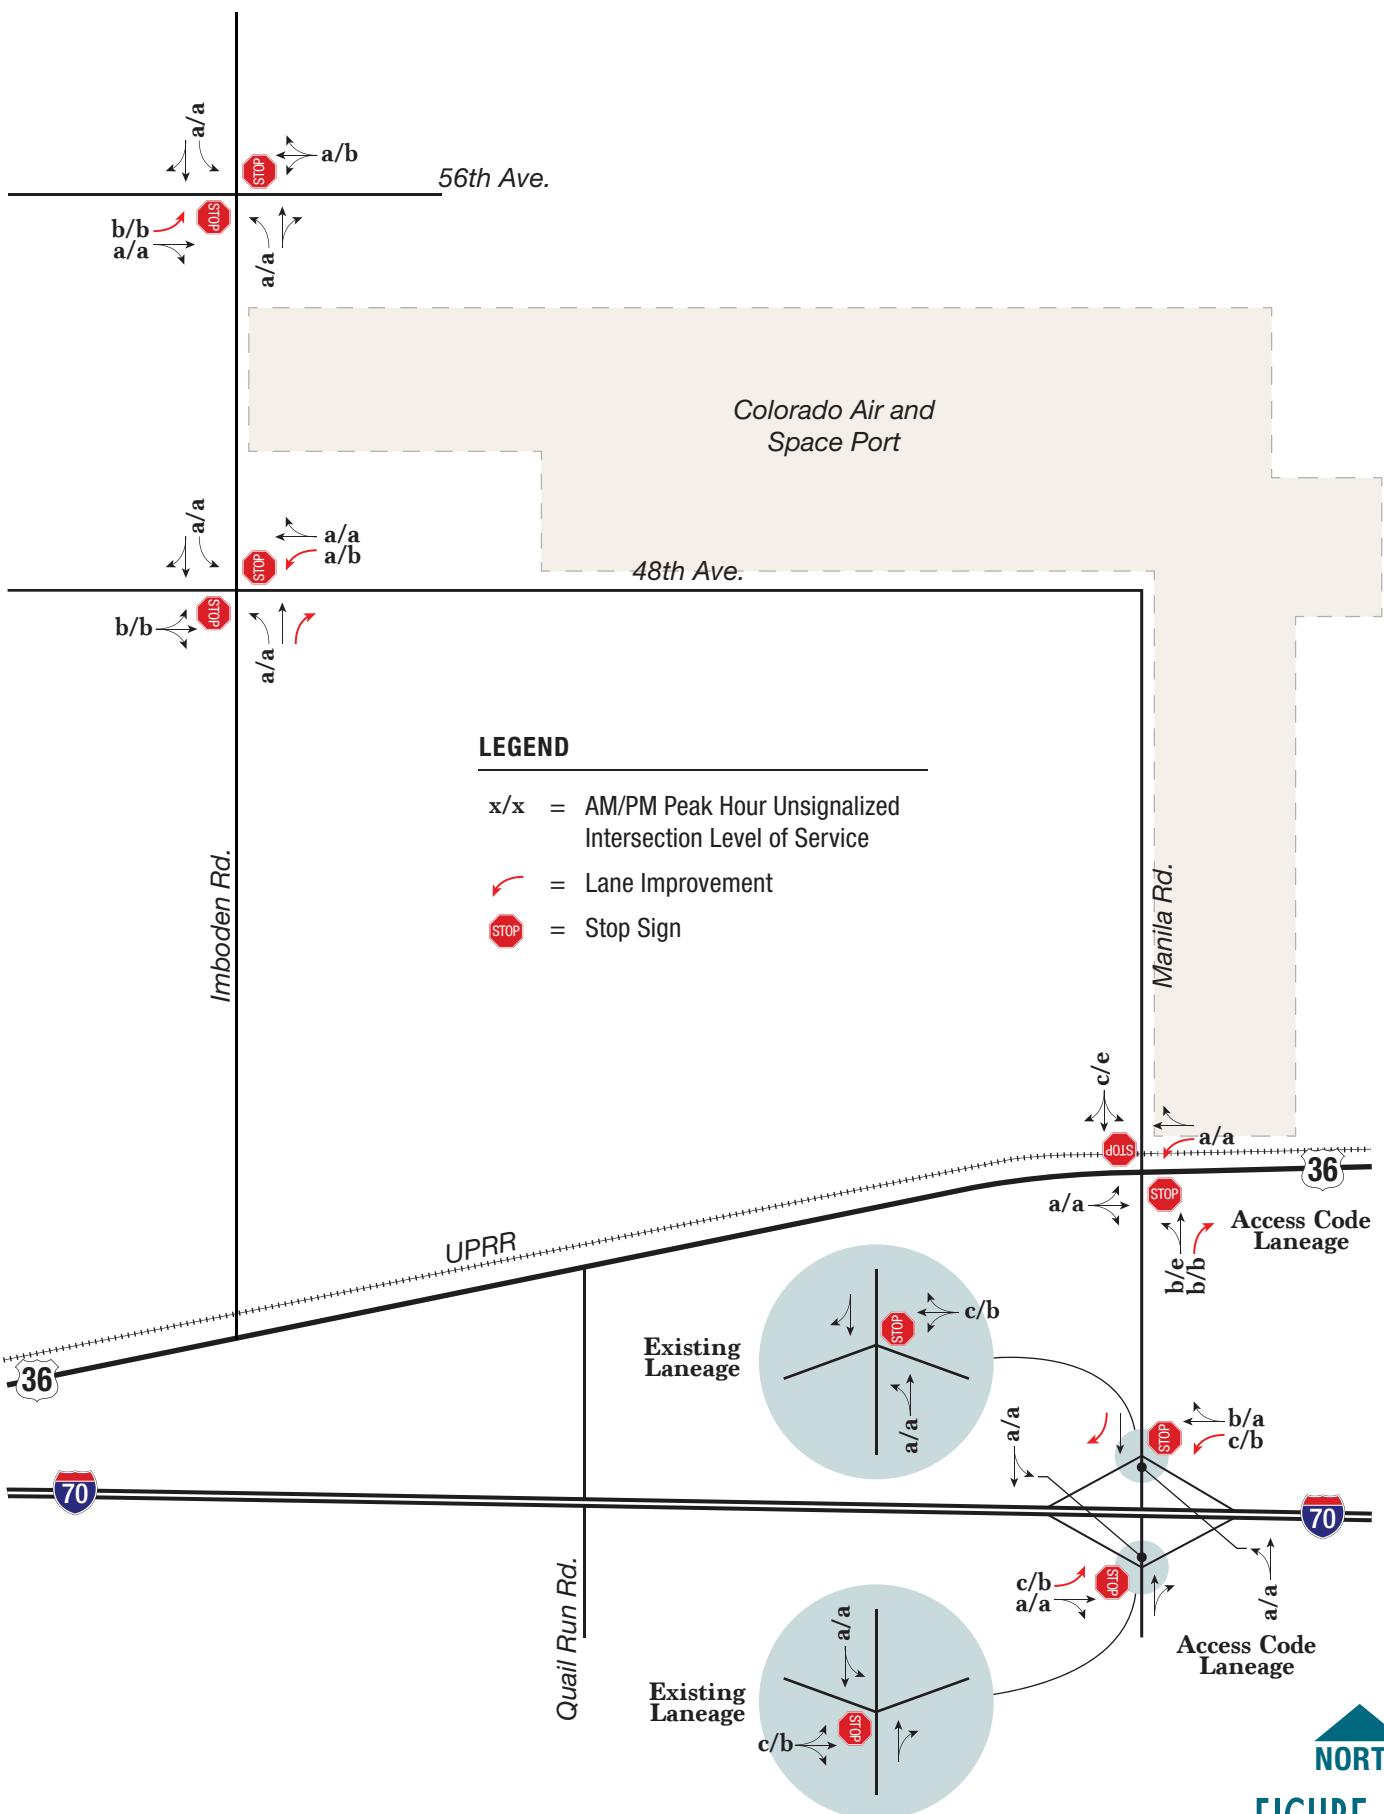

Considering these two sources, the traffic volumes represented on **Figure 5** contain projected background traffic volumes levels for the Year 2025 without the development of the two TransPort Colorado parcels.

As can be seen from this information, there are certain movements that become relatively sizable, primarily related to the development of the Rocky Mountain Rail Park. For example, the northbound right turn and westbound left turn at the US 36/Manila Road intersection reach 300 vehicles each hour (vph) during the peak hours, while the eastbound left turn and southbound right turn at the I-70 interchange are also quite high. When compared to existing traffic volumes, and considering the percentage growth rates, most of the traffic volume increases can be attributable to the construction of the Rocky Mountain Rail Park.

Figure 6 illustrates both the projected laneage needs based on State Highway Access Code (the Code) criteria for which the City of Aurora follows to determine where auxiliary lanes should be installed, along with the operational results. Increases in background traffic require a number of improvements when considering the Code criteria:

- 56th Avenue/Imboden Road – Eastbound left turn lane
- 48th Avenue/Imboden Road – Northbound right turn lane and westbound left turn lane
- US 36/Manila Road – Northbound right turn lane and westbound left turn lane
- I-70 Westbound Ramp/Manila Road – Southbound right turn lane and westbound left turn lane, recommendation to CDOT is to defer improvements until further development occurs
- I-70 Eastbound Exit Ramp/Manila Road – Eastbound left turn lane, recommendation to CDOT is to defer improvements until further development occurs

As can be seen on **Figure 6**, northbound and southbound movements across or onto US 36 on Manila Road are projected to experience LOS E during the PM peak hour. This level of delay can primarily be related to the development of the Rocky Mountain Rail Park which is located on the east side of the Space Port adjacent to Petterson Road. For example, the northbound right turn and westbound left turn at this intersection reach 300 vehicles per hour (vph) during the peak hours which results in smaller vehicle gaps for northbound and southbound movements to proceed into or across this intersection.

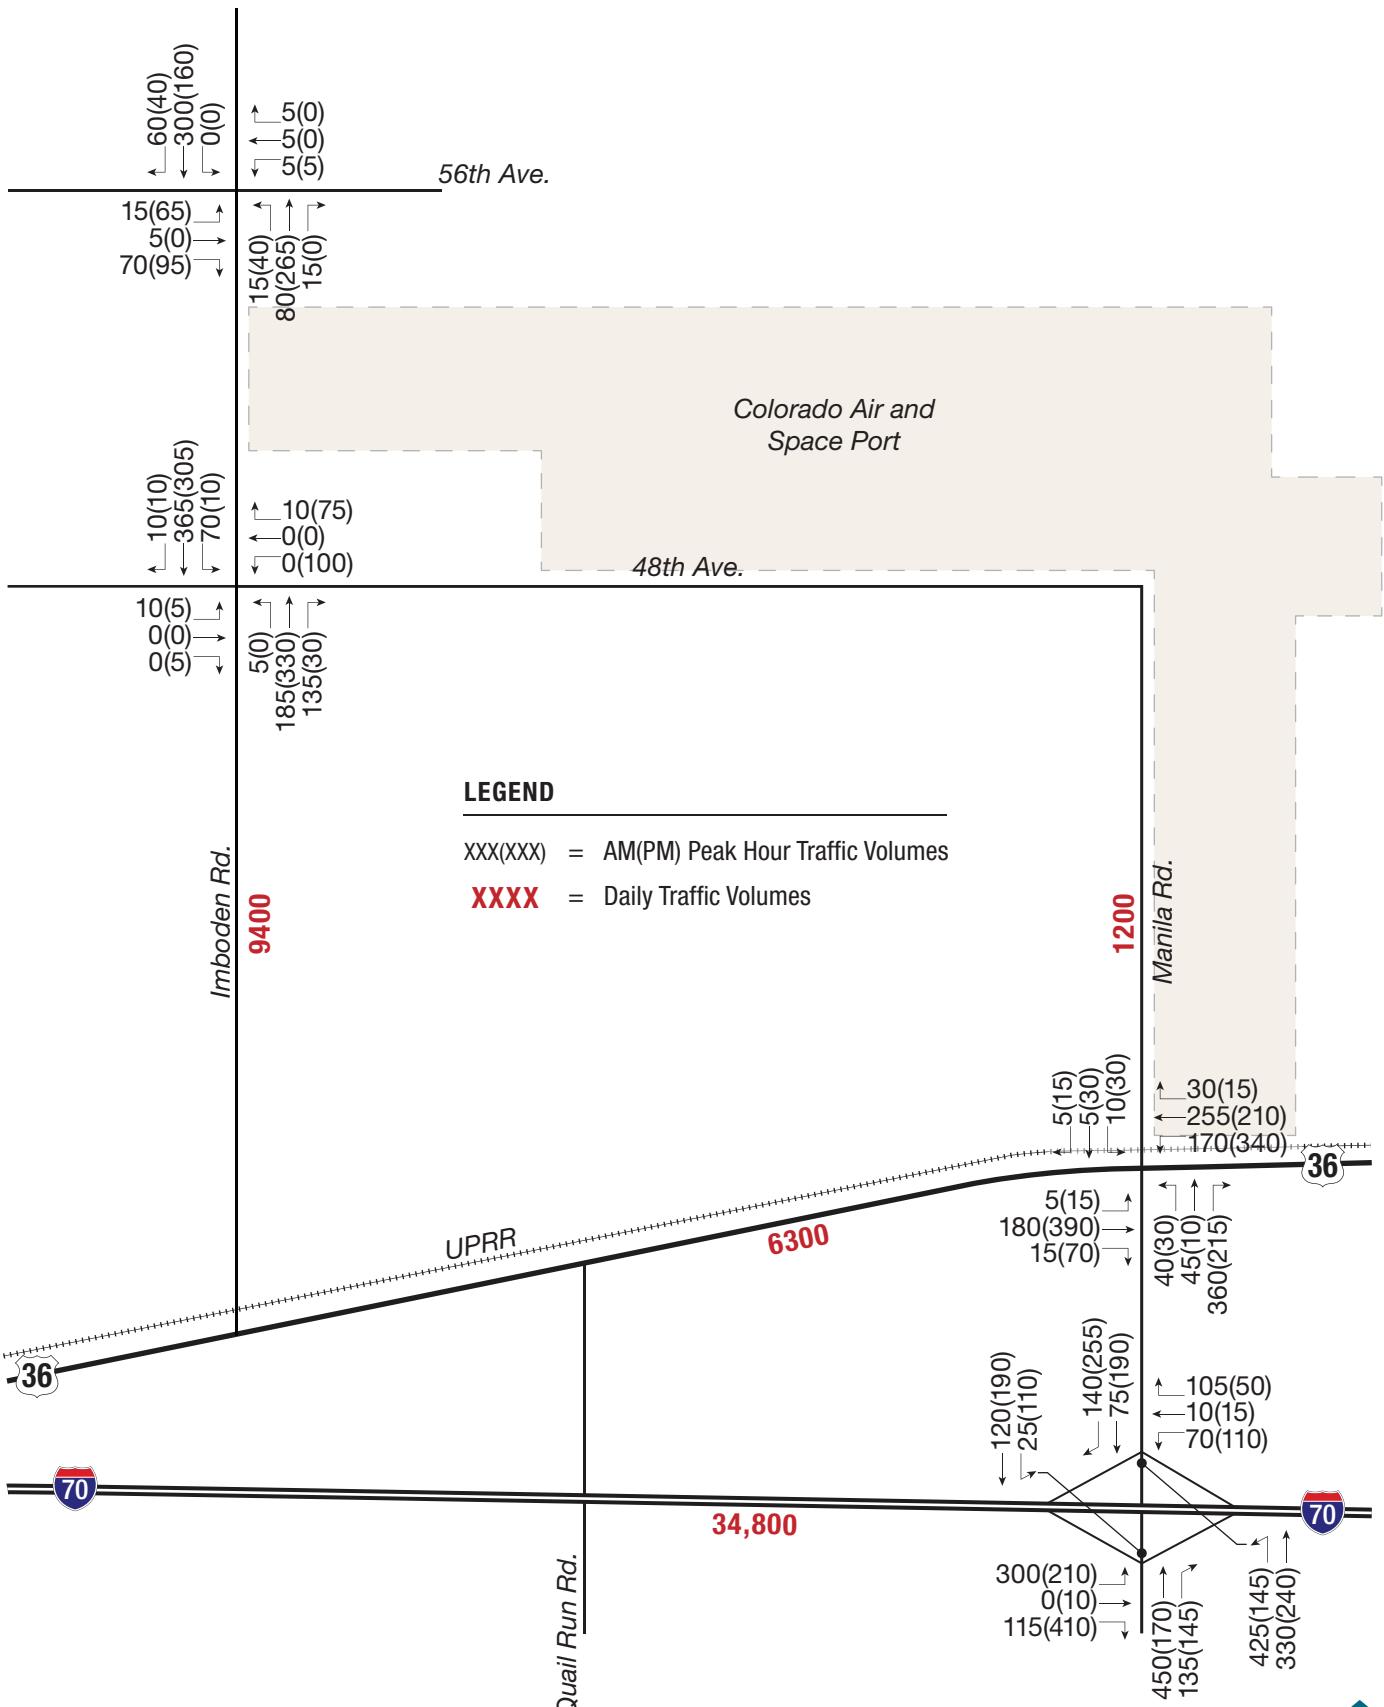

Year 2040

Similar to the Year 2025, background traffic projections used yearly growth rates but for a longer time period along with the projections for the Rocky Mountain Rail Park. Annual growth continues at a 6.4% pace for a total of about 290% over the next 20 years. When combined, the background traffic volume projections for the Year 2040 are included on **Figure 7**.

Figure 8 illustrates the projected laneage needs and operational analyses when considering the Code criteria. These analyses find that the following improvements are required for the Year 2040 background conditions:

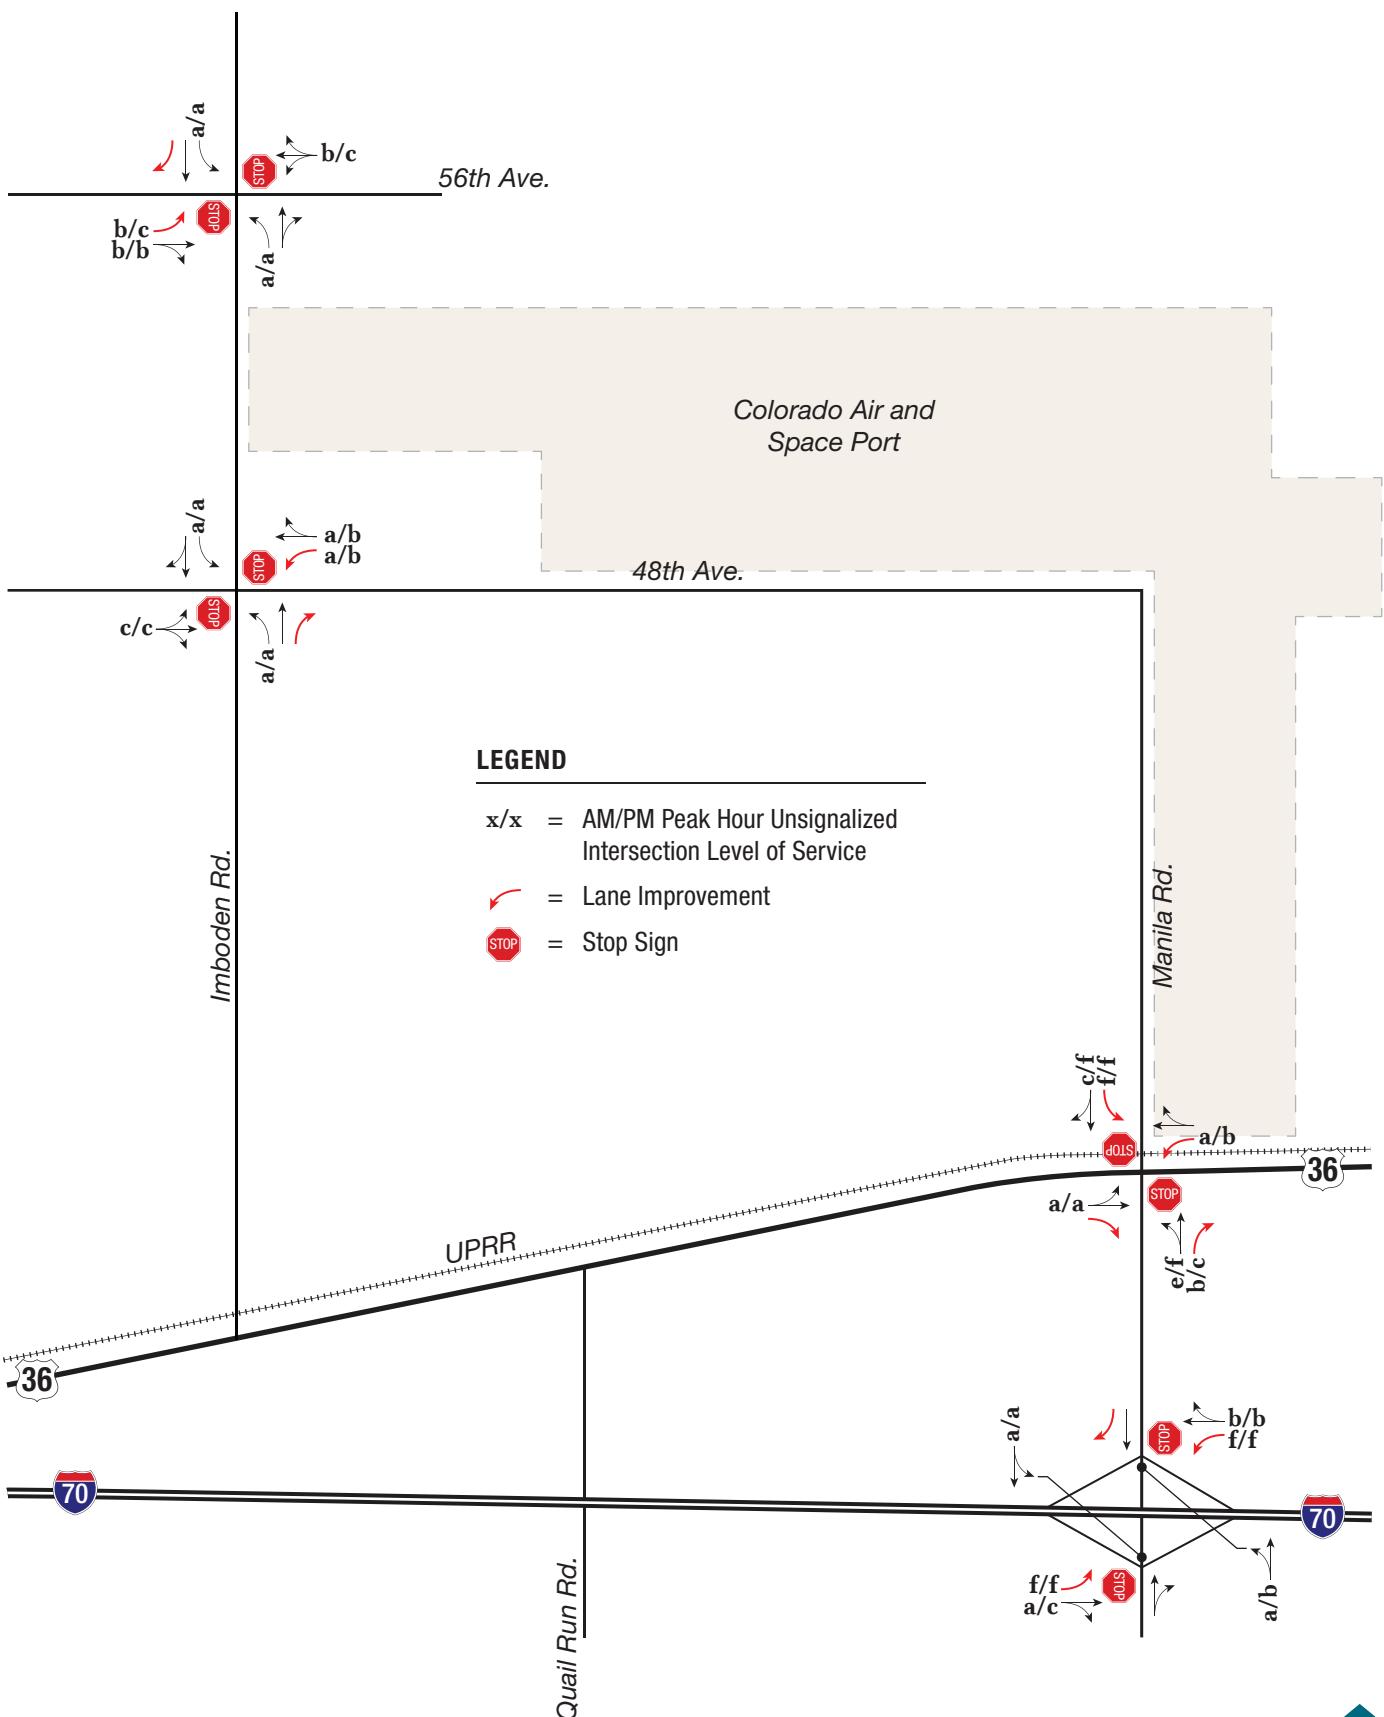

- 56th Avenue/Imboden Road – Eastbound left turn lane and southbound right turn lane
- 48th Avenue/Imboden Road – Northbound right turn lane and westbound left turn lane
- US 36/Manila Road – Northbound right turn lane, eastbound right turn lane, southbound left turn lane, and westbound left turn lane
- I-70 Westbound Exit Ramp/Manila Road – Southbound right turn lane and westbound left turn lane
- I-70 Eastbound Exit Ramp/Manila Road – Eastbound left turn lane

Regardless of the operational conditions for years 2025 or 2040, none of these intersections are projected to meet traffic signalization warrants as defined by the *Manual On Uniform Traffic Control Devices* (MUTCD) under background conditions. Peak hour signalization warrants for background conditions have been included in **Appendix D**. While analyzed for the purposes of completeness in this report, the year 2040 analyses do not take into account the current CDOT system level feasibility study for this area of I-70. That study is in its early stages and no recommendations are available at this time. As that report develops, it will consider TransPort Colorado impacts along with other nearby developments to assist in making decisions related to roadway and interchange recommendations.

2040 Background
Operational Conditions

IV. ISP I DEVELOPMENT CONDITIONS

This section summarizes the land use information, traffic volume projections, and operational analyses for the development of the proposed transload facility and a 288,000sf warehouse.

IV.A. ISP I Land Uses

Two parcels are currently being planned for this ISP I submittal. The transload facility will occupy approximately 76 acres on which there will be several rail track alignments to manage freight deliveries. Space will be provided for certain transload operations where materials will be stored on-site for pick-up or drop-off by local businesses. The transload site will be the starting point for future short-track delivery of materials to several industrial parcels in TransPort Colorado. Besides the rail track alignments, only a small amount of office space for employees will be provided (1,500 – 2,000sf).

The warehouse site is planned for 288,000sf of building on approximately 40 acres. Office space, inside storage and loading docks, along with outdoor storage will be available.

Figures 9 & 10 represent the proposed site plans for these two sites. Access for both sites will be along 32nd Avenue which will extend between Manila and Imboden Roads. Both sites will be along the south side of this street. Access for the transload facility will be located at the approximate alignment of an extension of Cavanaugh Road, while access for the warehouse is to the west of a new drainage channel adjacent to Manila Road.

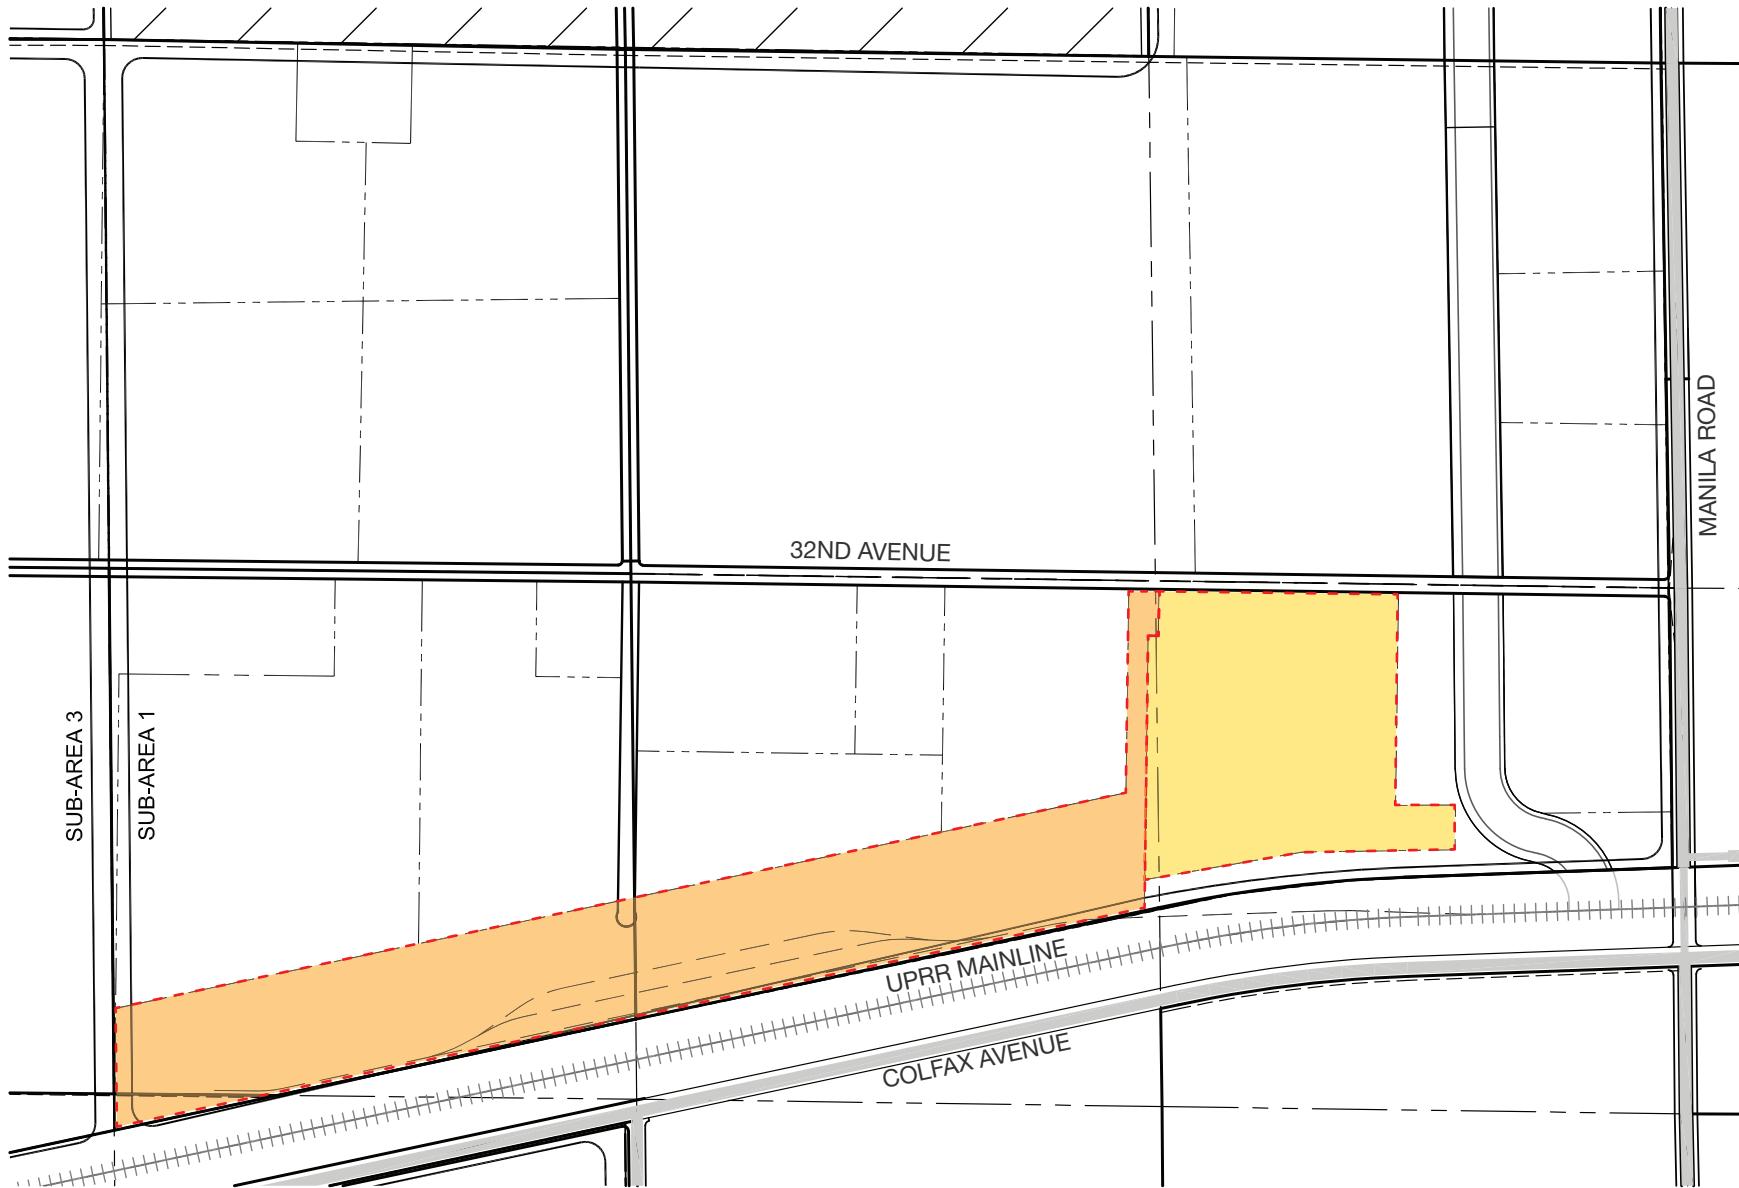

IV.B. Trip Generation Estimates

Table I includes the trip generation estimates for the two development sites. These estimates are based on operational discussions with the owners of the transload facility, Alpenglow Rail. Those discussions found that an average of six rail cars will be delivered to the site each day. Some of those rail cars will be shipped directly to future warehouse sites, while others will be unloaded on-site for pick-up by delivery trucks. Each rail car requires only two semi-trucks for deliveries. Only three employees will work at the site during a normal weekday schedule.

Estimates for the warehouse site use the Light Industrial trip generation category contained in *Trip Generation, 10th Edition*, by the Institute of Transportation Engineers (ITE), 2017 to be consistent with previous analyses for the TransPort Colorado FDP submittal. The site has a total of four driveways; two for employee/customer use and two for delivery use. The delivery path is one way with trucks entering on the east and exiting on the west side of the site.

Table I. ISP I Trip Generation Estimates

Land Use	Acres (±)	Building Square Footage (ksf)	Daily Vehicle- Trips	AM Peak Hour			PM Peak Hour			
				In	Out	Total	In	Out	Total	
Transload Facility	76	1.5-2.0	35	4	1	5	1	4	5	
Warehouse	40	288	1,149	86	12	98	10	67	77

FIGURE 10

Warehouse Site Plan

IV.C. Trip Distribution & Assignment

Estimates of vehicle routing to/from the transload and warehouse sites were developed based on the location of each site and on the available access routes. Both sites will have a strong orientation to/from I-70 along Manila Road, but two access scenarios for movements to/from the west are evaluated in this report due to the timing of land annexation:

Scenario A – This access scenario is the preferred one and it will likely be the one constructed. Access to/from the west will occur along 32nd Avenue with a connection to Imboden Road. Part of the roadway will be designed to facilitate the future construction of the Imboden Road/Quail Run Road alignment, i.e., there will be a “Z” movement in the roadway as represented on **Figure 11**. Access to/from the west can also occur along Manila Road and 48th Avenue, but that route is considered less convenient, but it is available.

Scenario B – Vehicles will travel to/from the west along 32nd Avenue, but would be required to travel along a new road that follows the future alignment of Quail Run Drive. Motorists would then access 48th Avenue, then Imboden Road. This scenario is much less convenient for patrons of the two development sites; it is also represented on **Figure 11**.

Figure 12 provides a summary of the trip distribution estimates and **Figure 13** illustrates the projected site generated traffic volumes for the two development sites. As can be seen on these figures, given the industrial/warehousing nature of these two projects, the projected vehicle trips have a high orientation towards I-70 and particularly towards the west to/from the Denver metropolitan area. It can also be seen that the largest vehicle levels are less than 70 vph (across US 36), along with the left turn and right turn movements at the eastbound and westbound I-70 ramp terminals.

IV.D. 2025 Total Traffic Volumes

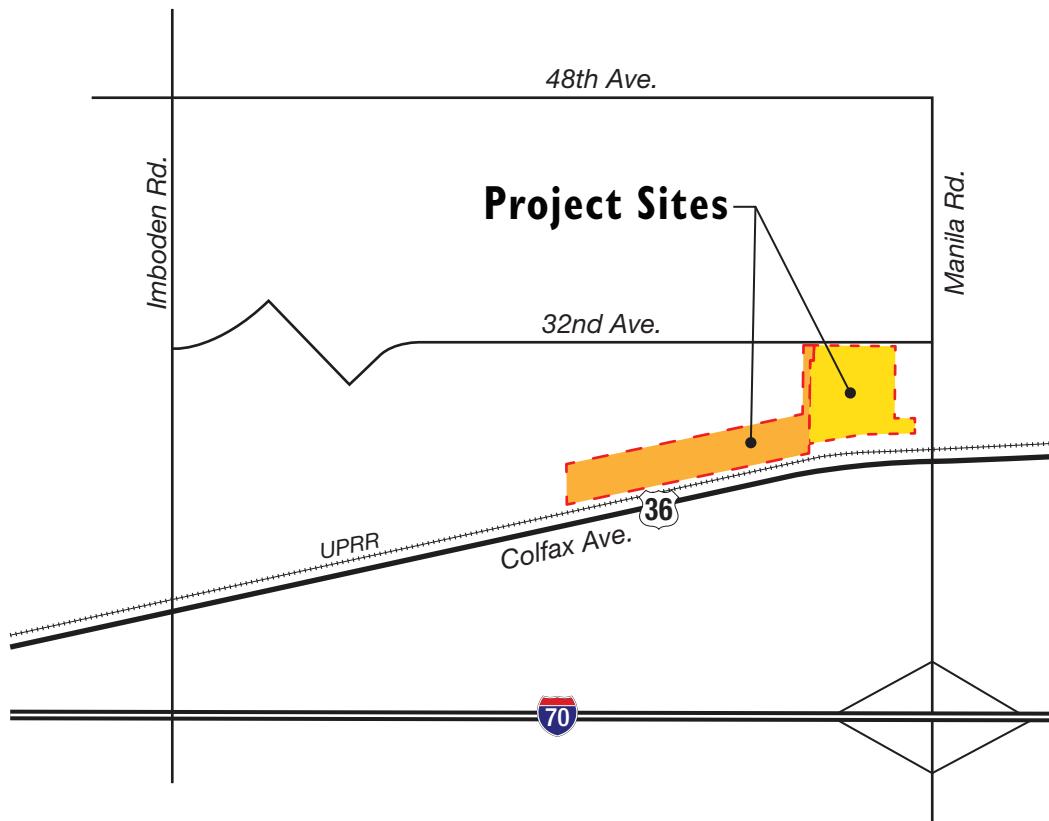

Figure 14 represents the combination of projected background traffic volumes along with the estimated site generated volumes for year 2025, including the two access scenarios described previously. As you can see from this information, certain intersection movements reach levels in excess of 300 vehicle trips during the AM and PM peak hours:

- US 36 westbound left turn at Manila Road (310 in the PM peak hour) (primarily related to the RMRP)
- Northbound Manila Road right turn at US 36 (335 in the AM peak hour) (primarily related to the RMRP)
- Southbound right turn on Manila Road at the westbound I-70 ramp terminal (272 in the PM peak hour)
- Eastbound left turn onto Manila Road from the eastbound I-70 ramp terminal (317 in the AM peak hour)

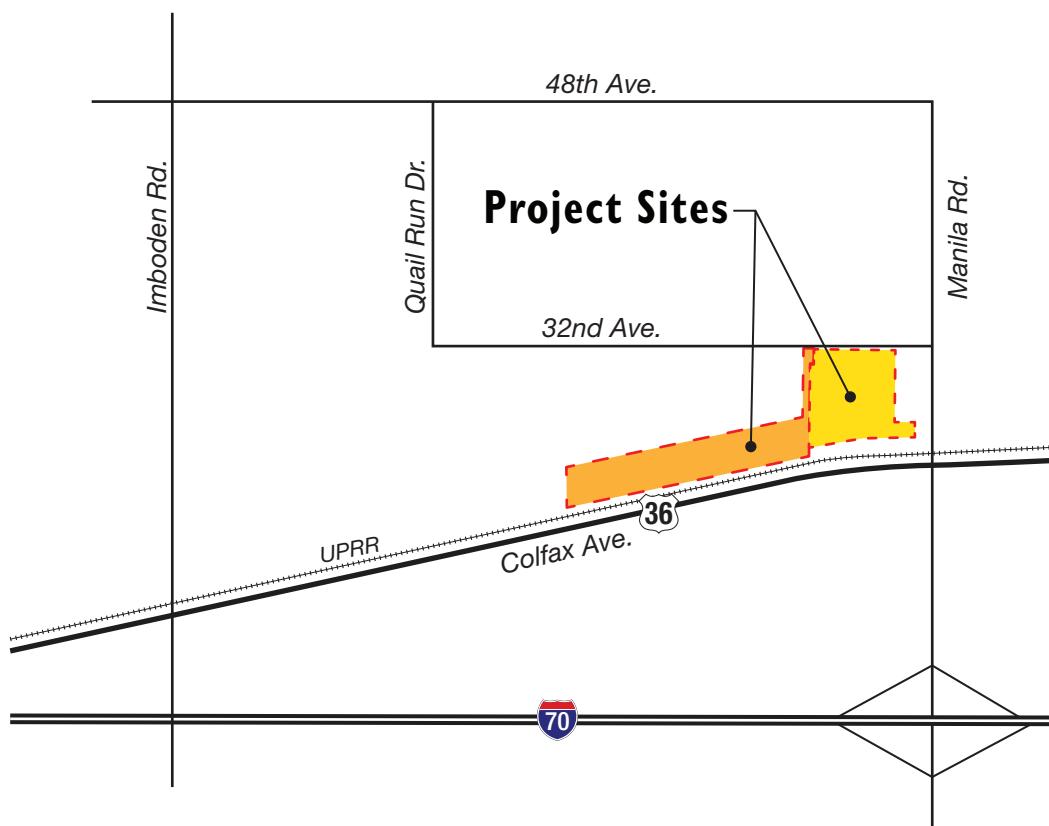

The directionality and peak periods for these movements is not surprising, i.e., towards the north and east during the AM peak hour and to/from the south and west during the PM peak hour.

Volume levels at intersections on Imboden Road remain relatively low with no turning movements exceeding 50 vehicles and no through movements exceeding 170 during in the peak hours.

IV.E. 2025 Operational Conditions

Intersection operations for both access scenarios are projected to operate at LOS C or better except for a few vehicle movements:

US 36/Manila Road Intersection – Northbound movements on Manila Road that attempt maneuvers across or onto US 36 are projected to experience sufficient average vehicle delay to result in LOS F during the PM peak hour. While these movements are not excessive, they are impeded by the large number of westbound left turn movements that are mostly attributable to the Rocky Mountain Rail Park. As noted previously for background conditions, the rail park projects over 300 westbound left turns during the PM peak hour which results in smaller vehicle gaps for northbound and southbound movements to proceed into or across this intersection. Of note, vehicle queuing on the southbound approach is not projected to extend to the UPRR tracks.

Traffic signal warrant analyses (see **Appendix F**) find that this intersection is not projected to meet warrants for traffic signal installation by completion of the first two development parcels. As such, if all of the vehicle-trips associated with the Rocky Mountain Rail Park come to fruition, northbound and southbound motorists will experience a higher level of delay than desired during the PM peak hour. Traffic volumes should be monitored and signalization warrants checked periodically as TransPort Colorado and the Rocky Mountain Rail Park advance.

Westbound and Eastbound I-70 Ramp Terminals – While the southbound right turn movement and both the westbound and eastbound left turn lanes have been identified as meeting Code criteria for installation during both the 2025 background and build scenarios, it is believed that those improvements could be deferred until additional development occurs in the area. Like background conditions, **Figure 15** finds that there are similar LOS results with or without these improvements (LOS C or better). **Appendix G** provides the LOS worksheets.

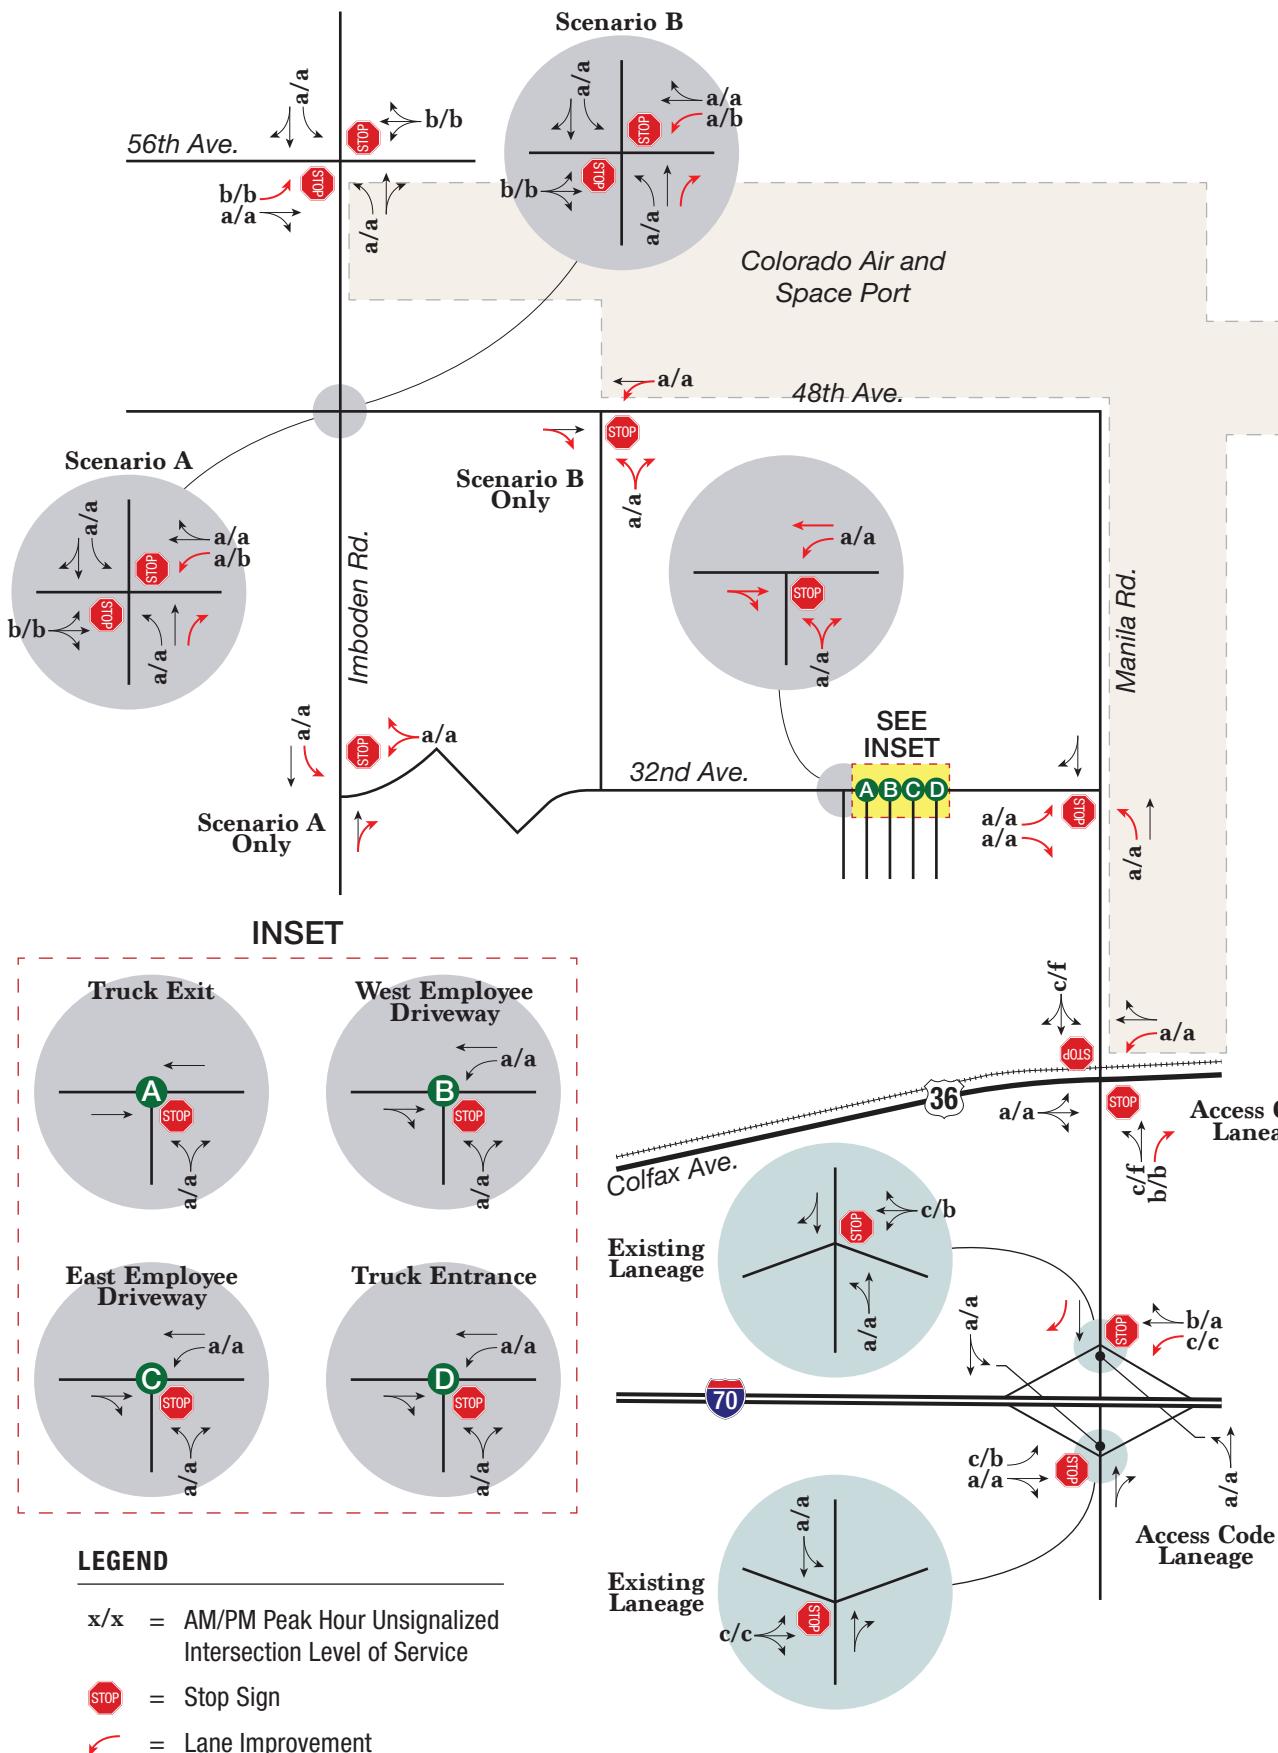

IV.F. 2040 Total Traffic Volumes

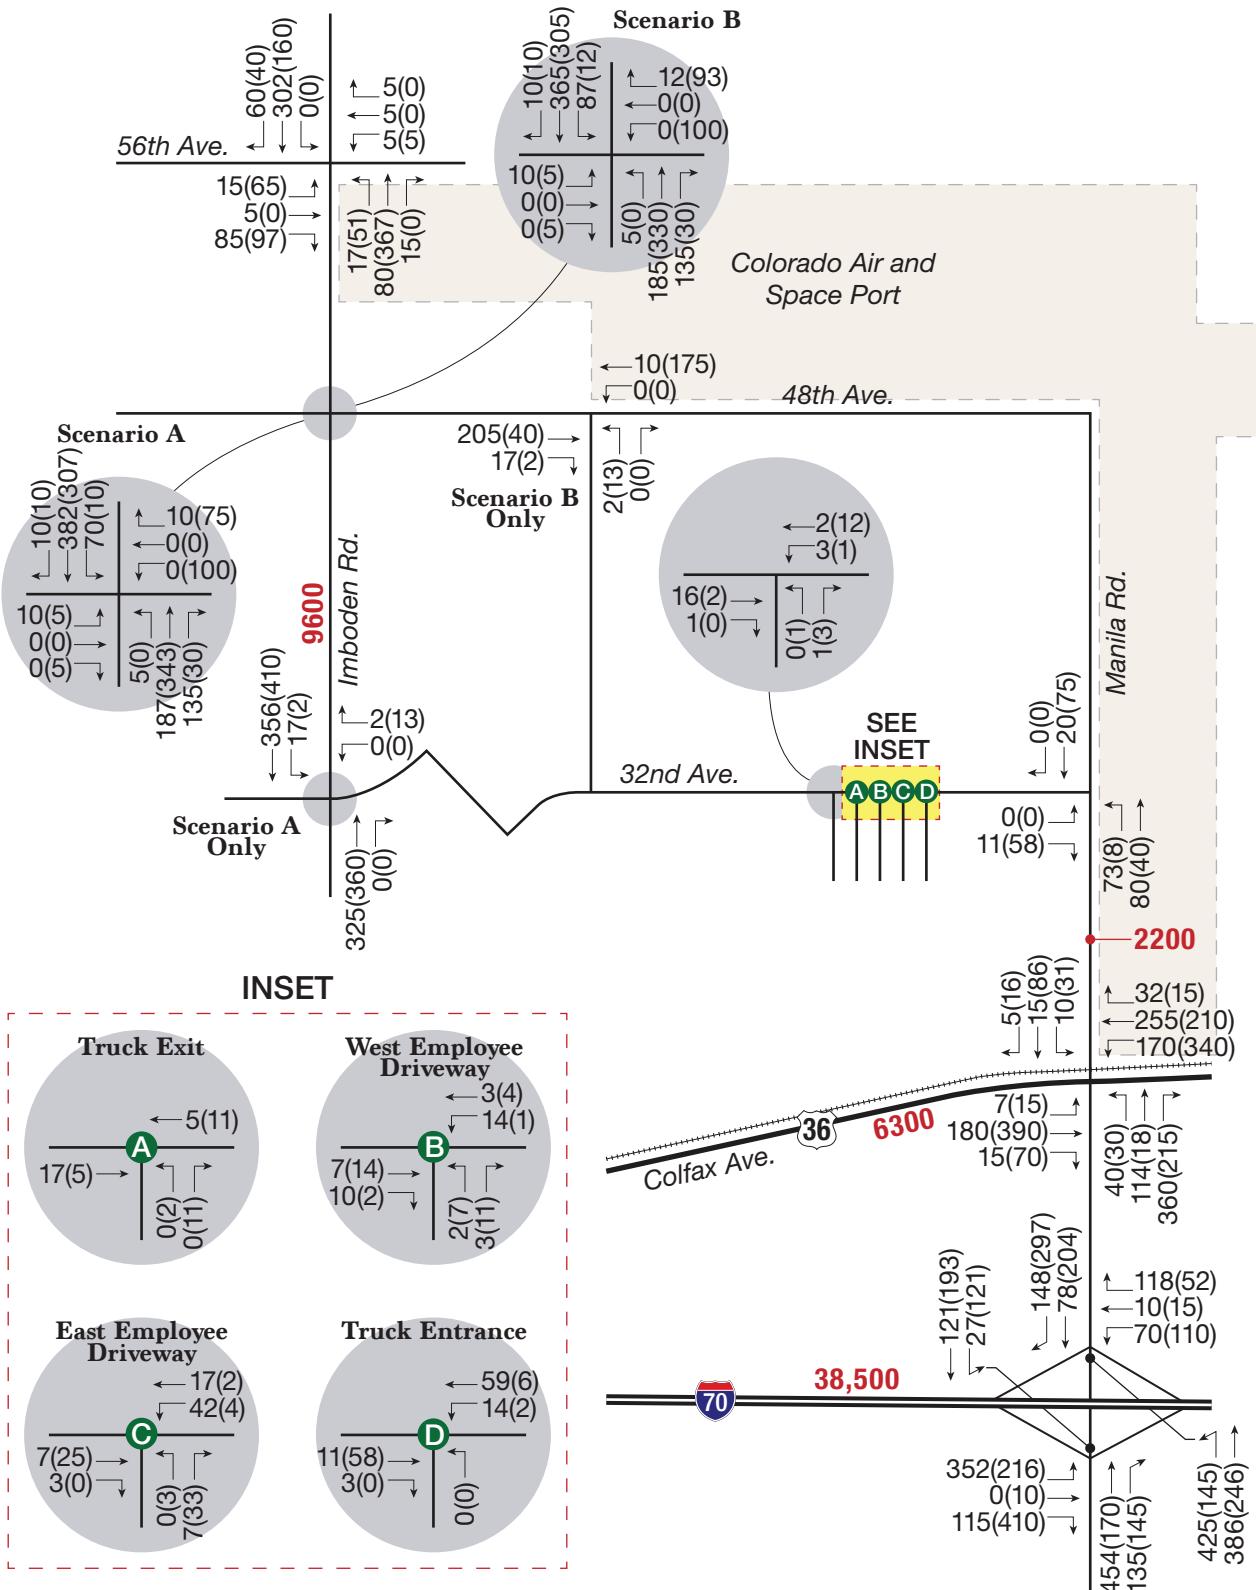

Figure 16 represents the combination of projected background traffic volumes along with the estimated site generated volumes for year 2040, including the two access scenarios described previously. As you can see from this information, certain intersection movements are now projected to reach levels in excess of 300 vehicle trips during the AM and PM peak hours, each related to an additional 15 years of background traffic growth from the year 2025 condition:

- US 36 westbound left turn at Manila Road (340 in the PM peak hour)
- Northbound Manila Road right turn at US 36 (360 in the AM peak hour)
- Southbound right turn on Manila Road at the westbound I-70 ramp terminal (297 in the PM peak hour)
- Eastbound left turn onto Manila Road from the eastbound I-70 ramp terminal (352 in the AM peak hour)

Once again, the directionality and peak periods for these movements is not surprising, i.e., towards the north and east during the AM peak hour and to/from the south and west during the PM peak hour.

Volumes at intersections on Imboden Road remain relatively low with no turning movements exceeding 140 vehicles and no through movements exceeding 390 during in the peak hours.

LEGEND

- XXX(XXX) = AM(PM) Peak Hour Traffic Volumes
 XXXX = Daily Traffic Volumes

IV.G. 2040 Operational Conditions

Intersection operations for both access scenarios are projected to operate acceptable except for a few vehicle movements, ones related to the primary travel paths to/from I-70:

US 36/Manila Road Intersection – Both northbound and southbound left turns are projected to experience sufficient average vehicle delay to result in LOS F during the AM and PM peak hours as will the southbound crossing maneuver of US 36 during the PM peak hour. As noted previously, these traffic volume levels are impeded by the large number of westbound left turn movements that are mostly attributable to the Rocky Mountain Rail Park.

Traffic signal warrant analyses contained in **Appendix F** find that this intersection is not projected to meet warrants for traffic signal installation by completion of the first two development parcels, although the criterion is close to being met during the PM peak hour. As such, if all of the vehicle-trips associated with the Rocky Mountain Rail Park come to fruition, northbound and southbound motorists will continue to experience a higher level of delay than desired during the peak hours. Vehicle queuing on the southbound approach is not projected to extend to the UPRR tracks, however,

Westbound I-70 Ramp Terminal – Similar to the year 2025 timeframe, certain movements will meet Code criteria for installation of additional lanes. And even with these additional lanes the westbound left turn is still projected to operate at LOS F during both the AM and PM peak hours. Traffic signalization warrants are not projected to be met, however.

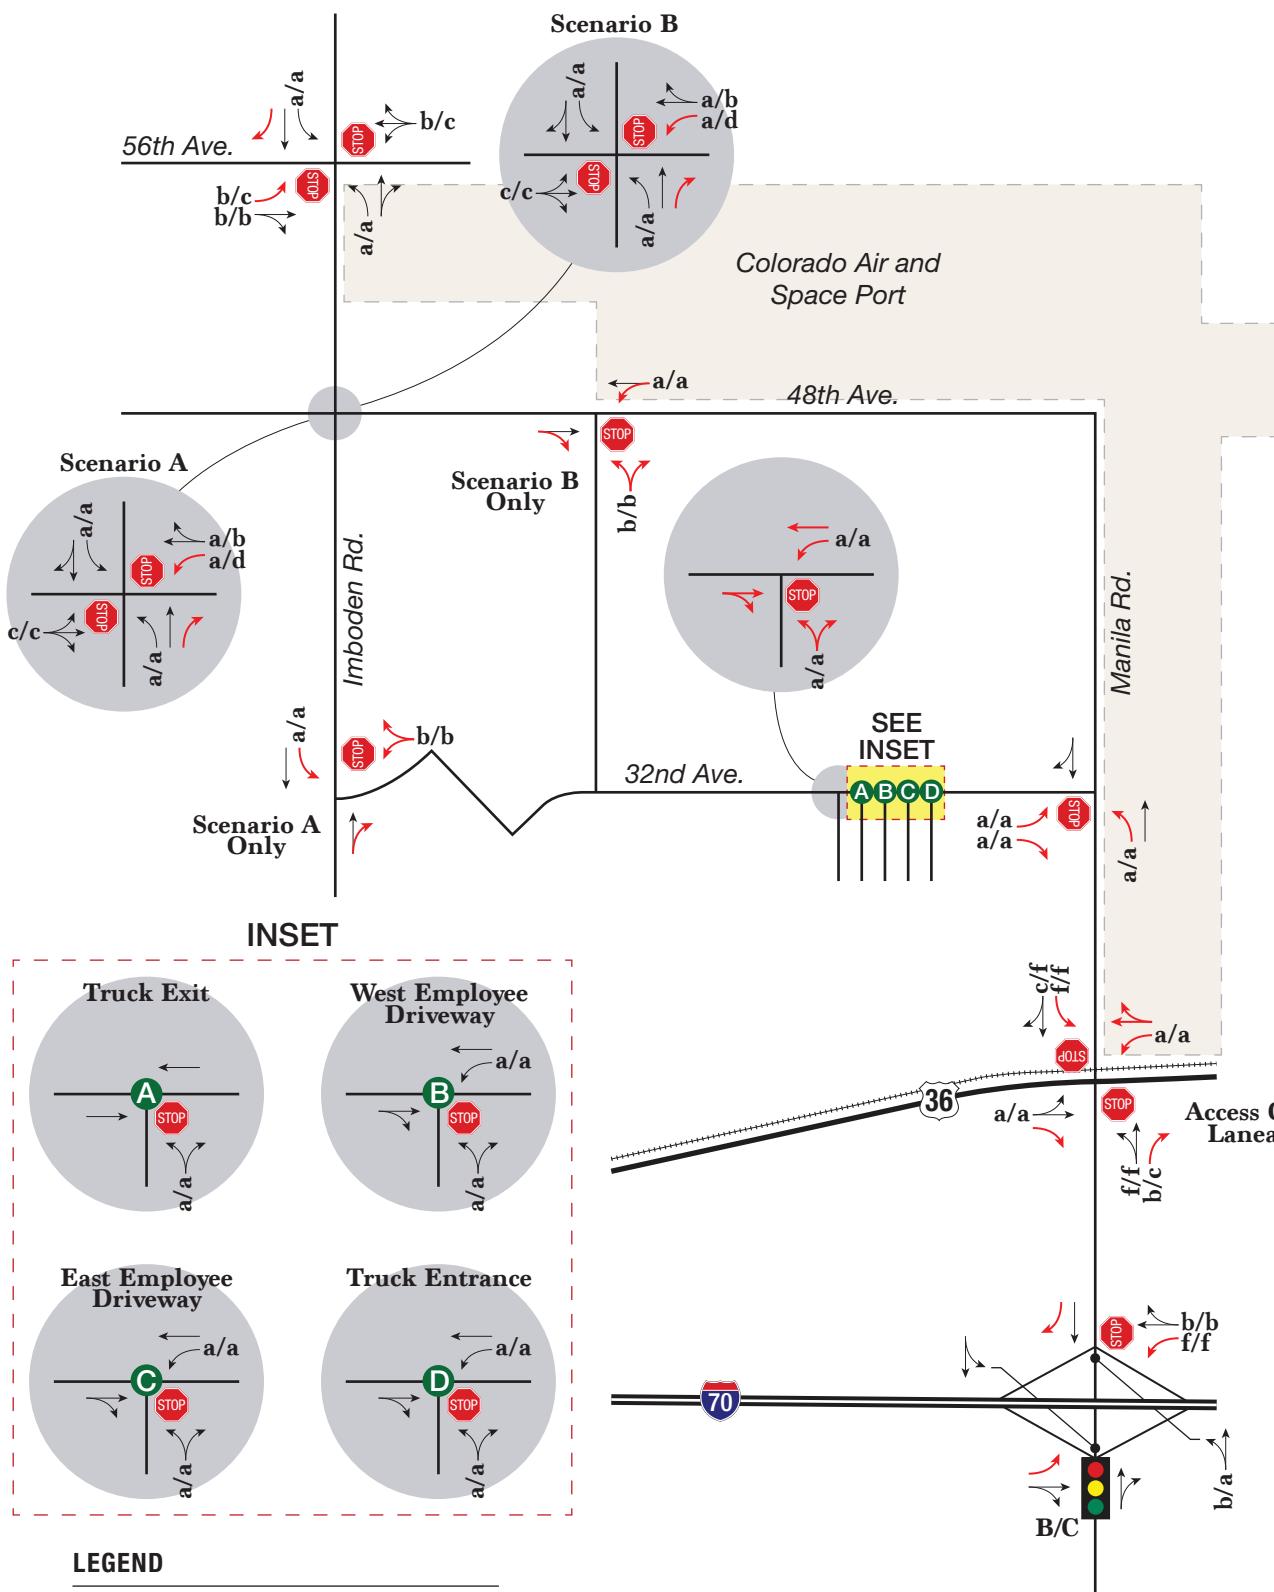

Eastbound I-70 Ramp Terminal – This intersection is projected to meet peak hour signalization warrants in addition to meeting Code criteria for installation of an eastbound left turn lane. LOS B/C is expected if this intersection is signalized.

Figure 17 illustrates the projected operations for the 2040 build scenario.

IV.H. Recommended Roadway Laneage

As can be seen on **Figures 16** (2025) and **17** (2040), intersection geometry recommendations are quite consistent between these two time periods with a few exceptions, primarily due to the same intersection movements being affected by background traffic growth when combined with the first two sites for TransPort Colorado. Through laneage requirements can remain as what exists today since the two development sites do not add much traffic to the overall street network.

Manila Road, Imboden Road, and 48th Avenue can remain as two-lane facilities, while the new 32nd Avenue should be designed as a Three Lane Collector to City of Aurora standards (one travel lane in each direction with a striped center median). This configuration will allow for the striping of left turn lanes at Manila Road (eastbound) and at each site access point. It is understood that 32nd Avenue is proposed to be constructed with a smaller cross-section to the west of the transload facility access point since turn lanes will not be necessary for that portion of the roadway at the currently proposed level of development.

IV.I Auxiliary Lane Recommendations

Projected traffic volume information along with the estimated intersection operational analyses were used to recommend the type and dimensional characteristics for each auxiliary lane that is needed for each intersection to function appropriately. City of Aurora *Traffic Impact Study Guidelines* indicate that the Code should be used to determine the auxiliary lane vehicle storage and taper lengths. These values can yield overly conservative estimates, however, which can result in vehicle storage well in excess of the 95th percentile projected queue lengths (which already incorporate a heavy vehicle percentage), often by an order of magnitude.

Additionally, the Code data do not account for other conditions at an intersection such as low opposing through movements, for example, if a left-turn movement is in question. Rather, it is recommended that the values in **Table 2** corresponding to the 95th percentile lengths be used for vehicle storage lengths along with transition tapers in accordance with Code sizing for NR-B facilities. Refer to **Table 3** on page 29 for auxiliary lanes that are the responsibility of TransPort Colorado.

Table 2. Auxiliary Lane Recommendations (Year 2025)

Intersection	Approach	Movement	95 th Percentile Queue Length (ft) ¹		Recommended Storage Length	Access Code Storage Length ²
			AM	PM		
Imboden Road/ 56 th Avenue	Eastbound	Left Turn	0	3	50'	40'
	Northbound	Left Turn	0	3	50'	40'
	Southbound	Left Turn	0	0	50'	25'
Imboden Road/ 48 th Avenue (Access Scenario A)	Westbound	Left Turn	0	8	50'	50'
	Northbound	Left Turn	0	0	50'	25'
	Southbound	Left Turn	3	0	75'	40'
Imboden Road/ 48 th Avenue (Access Scenario B)	Westbound	Left Turn	0	8	50'	40'
	Northbound	Left Turn	0	0	50'	25'
	Southbound	Left Turn	3	0	75'	50'
Imboden Road/ 32 nd Avenue (Access Scenario A)	Southbound	Left Turn	0	0	75'	40'
32 nd Avenue/ Transload Driveway	Westbound	Left Turn	0	0	75'	25'
32 nd Avenue/ West Employee Driveway	Westbound	Left Turn	0	0	50'	25'
32 nd Avenue/ East Employee Driveway	Westbound	Left Turn	3	0	50'	50'
32 nd Avenue/ Truck Entrance	Westbound	Left Turn	0	0	75'	50'

Intersection	Approach	Movement	95 th Percentile Queue Length (ft) ¹		Recommended Storage Length	Access Code Storage Length ²
			AM	PM		
Manila Road/ 32 nd Avenue	Eastbound	Left Turn	0	0	50'	25'
	Northbound	Left Turn	5	0	125'	125'
US 36/Manila Road	Westbound	Left Turn	8	30	100'	435'
	Northbound	Right Turn	55	18	100'	470'
Manila Road/I-70 Westbound Ramp	Southbound	Right Turn	0	0	0'	110'
	Westbound	Left Turn	20	13	50'	50'
Manila Road/I-70 Eastbound Ramp	Eastbound	Left Turn	110	28	150'	445'

¹ Calculations based on HCM methodology using a heavy vehicle percentage of 20 percent.

² Number shown is based on volume adjustments of 3 PCE per heavy vehicle.

Given the number of driveways on 32nd Avenue, all of which have westbound left turns, a continuous shared left turn lane should be installed from Manila to the west edge of full 32nd Avenue construction (except for eastbound at Manila) in preparation for future development on the north side of 32nd. This approach would align with the previous recommendations that 32nd Avenue should be designed as a 3-lane Collector.

VI.J Pedestrian Connectivity

The City of Aurora Three Lane Collector typical section will be constructed for 32nd Avenue. Pedestrian amenities will include a detached sidewalk along both sides of 32nd Avenue as well bike lanes. These infrastructure will ultimately connect with the larger pedestrian/bicyclist/trail network that is foreseen for all of TransPort Colorado, particularly a connection to the Bear Gulch Trail.

VI.K ISP I Improvements

While **Table 2** identified the auxiliary lane requirements at each of the study area intersections based on Code criteria, but not all of these movements reflect trips to/from the first two TransPort Colorado sites (they reflect improvements needed to satisfy background traffic growth). For example, an eastbound left turn movement at the Imboden Road/56th Avenue intersection, which requires a separate left turn lane, does not have any vehicle movements related to TransPort Colorado. As such, **Table 2** contains only a summary of the projected improvements needed for new streets or intersection movements related to the development of the first two TransPort Colorado parcels. The left turn lane improvements on Manila and Imboden Roads could be deferred, however, until additional development parcels are being considered since conflicting traffic volumes are relatively low and these intersections will continue to operate well without these left turn lanes.

Table 3. ISP I Improvement Recommendations

Location	Improvement
32 nd Avenue	Construct City of Aurora Three Lane Collector street between Manila Road and the western site boundary for the transload facility with a continuous shared left turn lane; the portion to the west of the transload facility can have a reduced cross-section.
Manila Road/ 32 nd Avenue Intersection	Stripe an exclusive eastbound left turn lane within the Three Lane Collector cross-section at Manila Road (50'); construct northbound left turn lane (435' deceleration length (includes 162' taper) with 125' of vehicle storage. Can be deferred until additional sites are developed.
Imboden Road/32 nd Avenue Intersection	Construct southbound left turn lane (435' deceleration length which includes 162' taper) with 75' of vehicle storage. Can be deferred until additional sites are developed.

V. SUMMARY AND RECOMMENDATIONS

TransPort Colorado, a multi-year master-planned business environment in the City of Aurora, is planning to construct the first two parcels of its overall development area. These two parcels will include a 288,000 square foot (sf) warehouse along with a rail transload facility that will eventually provide short-line rail access for numerous TransPort Colorado warehouse and industrial parcels.

The first two parcels will be located along 32nd Avenue near Manila Road in the approximate southeast quadrant of TransPort Colorado. Given the industrial/warehousing nature of these sites, the primary access route will be along Manila Road to/from the I-70/Manila Road interchange, while secondary access will be provided to/from the west via 32nd Avenue and Imboden Road for trips towards the northwest via Imboden Road and 56th Avenue.

32nd Avenue between Manila and Imboden Roads is planned to be constructed as part of this project, while an alternate route that uses part of the new 32nd Avenue and a new Quail Run Drive alignment may be used depending upon land annexation timeframes.

The two development parcels will have direct access to 32nd Avenue and vehicle movements to/from the sites will use the Three Lane Collector street typical section that includes one through lane for vehicle movements in each direction along with a striped center turn lane.

Trip generation for the two development sites is projected to be 1,183 on a daily basis, with 103 trips during the AM peak hour and 82 during the PM peak hour. These levels are relatively low trip generation levels given the amount of acreage that the two parcels cover – not unexpected for these types of land uses, however.

Only a few intersection improvements have been identified beyond those intersection improvements that are already needed, or that should be constructed as part of the Rocky Mountain Rail Park (see table below). While these improvements meet the City of Aurora criteria for installation, operational analyses find that the left turn lanes on Manila and Imboden Road could be deferred until other sites in TransPort Colorado are proposed for development.

Location	Improvement
32 nd Avenue	Construct City of Aurora Three Lane Collector street between Manila Road and the western site boundary for the transload facility with a continuous shared left turn lane; the portion to the west of the transload facility can have a reduced cross-section.
Manila Road/ 32 nd Avenue Intersection	Stripe an exclusive eastbound left turn lane within the Three Lane Collector cross-section at Manila Road (50'); construct northbound left turn lane (435' deceleration length (includes 162' taper) with 125' of vehicle storage. Can be deferred until additional sites are developed.
Imboden Road/32 nd Avenue Intersection	Construct southbound left turn lane (435' deceleration length which includes 162' taper) with 75' of vehicle storage. Can be deferred until additional sites are developed.

APPENDIX B. LEVEL OF SERVICE CRITERIA

TABLE B1
LEVEL OF SERVICE CRITERIA FOR
TWO-WAY STOP CONTROLLED (TWSC) INTERSECTIONS AND ROUNDABOUTS

Level of Service	Delay Range (sec/veh)
A	0.0 – 10.0
B	>10.0 – 15.0
C	>15.0 – 25.0
D	>25.0 – 35.0
E	>35.0 – 50.0
F	> 50.0

Adapted from *Highway Capacity Manual*, Transportation Research Board, 2010.

TABLE B2
LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

Level of Service	Control Delay (sec/veh)	Qualitative Description
A	≤ 10.0	Good progression, short cycles, very few vehicle-stops.
B	>10.0 – 20.0	Good progression, and/or short cycle lengths, more vehicle-stops.
C	>20.0 – 35.0	Fair progression and/or longer cycle lengths, some individual cycle failures, many vehicle-stops
D	>35.0 – 55.0	Noticeable congestion and cycle failures, unfavorable progression, high v/c ratios, several stops.
E	>55.0 – 80.0	Limit of acceptable delay, poor progression, long cycles, high v/c ratios, frequent cycle failures.
F	> 80.0	Delay is unacceptable to most drivers, volume exceeds capacity, breakdown of traffic flow.

Adapted from *Highway Capacity Manual*, Transportation Research Board, 2010.
