I. INTRODUCTION

Harvest Crossing is a planned development encompassing approximately 200 acres east of E-470 in Aurora, Colorado. The site is located in the southeast quadrant of the Harvest Rd / E. Jewell Ave intersection and is directly east of the Murphy Creek East development. The development stretches east to the future Kewaunee Street and south to the future Yale Ave. **Figure 1** shows the site location in relation to major roadways and developments in the area.

The Harvest Crossing development is anticipated to be constructed in several phases. Filing 1 (residential) was approved and is currently under construction with completion anticipated in late 2024. It is located between Pacific Ave and Warren Ave roughly representing the middle third of the site in the north-south direction. Filing 2 (commercial and additional residential) is proposed to be completed in 2026 (after Filing 1) and will be located between Jewell Ave and Pacific Ave immediately north of Filing 1. Filing 3 (residential) is expected to follow as the final phase based on market conditions and includes the area south of Filing 1 between Warren Avenue and Yale Ave.

The proposed Harvest Crossing land uses include:

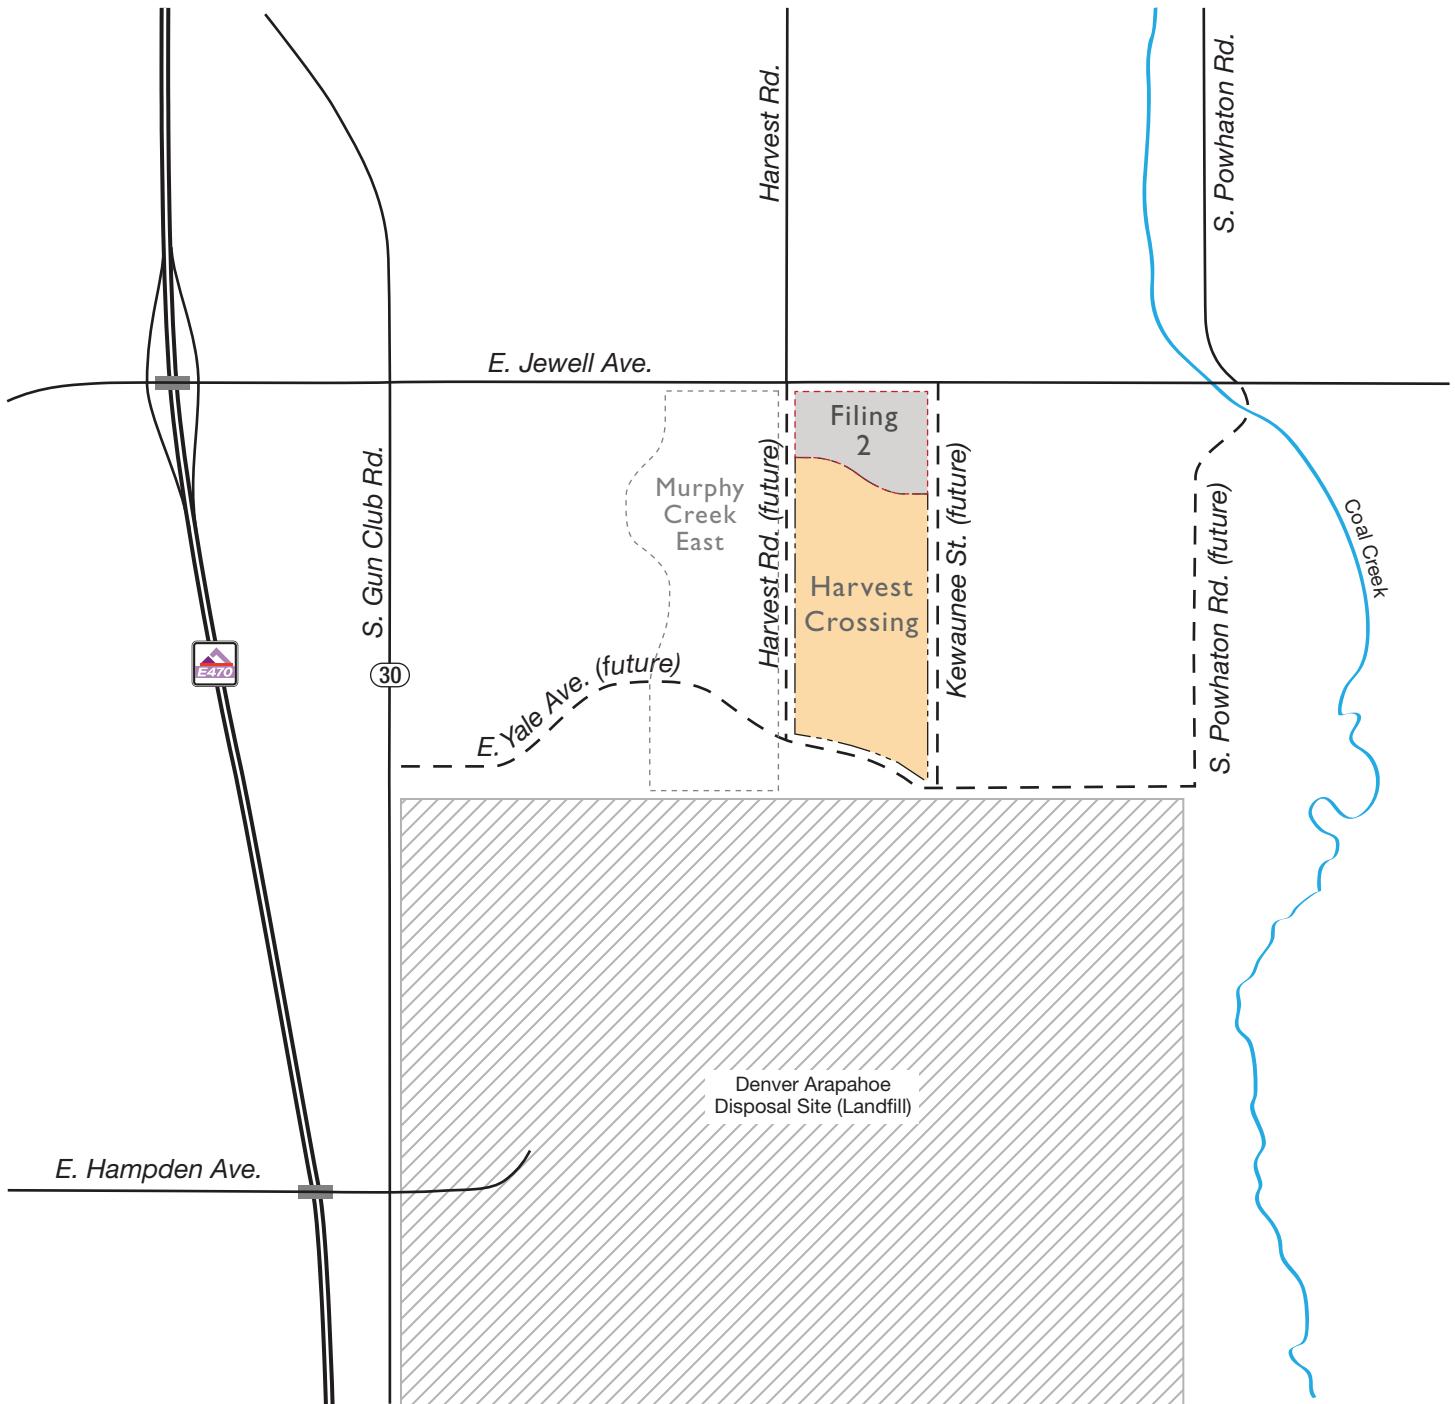

- The previously approved 145 single family dwelling units (DU) in Filing 1
- Filing 2, the subject of this study, currently proposed to include 227 single family DU, but has been analyzed with 230 for the purpose of this study to remain conservative, and 76,500 square feet of commercial
- An additional 449 single family DUs in Filing 3

Hence, the total buildup of Harvest Crossing will include approximately 824 DUs and 76,500 square feet of commercial space. These land uses are anticipated maximums and represent a conservative analysis.

Several access points onto the adjacent transportation network will be provided in the short-term. Filing 1 is expected to add a fourth leg to the Pacific Ave / Harvest Rd and Warren Ave / Harvest Rd intersections. These will align with roadways constructed by Murphy Creek East west of Harvest Rd. Filing 2 is expected to add additional site access points to support the remaining development, including two access points onto E. Jewell Ave, two access points on Kewaunee St between E. Pacific Ave and E. Jewell Ave, and one access on Harvest Rd between E. Jewell and E. Pacific Ave. Filing 3 is anticipated to add additional site access points to accommodate the remaining development in the future. **Figure 2** shows the Filing 2 site plan and access points.

Two future planning horizons have been evaluated for the site:

- **Short-Term Future (Filing 2):** The Year 2026 time-period (3-year horizon from the existing conditions analyzed in this study) was chosen to assess traffic related to the proposed Filing 2 development. It includes full buildup of Filing 1 as a background condition.
- **Long-Term Future:** Year 2040 was selected for long-term analyses, consistent with the current long-term planning timeframe used in the 2018 Refresh of the Northeast Area Transportation Study (NEATS). The 2040 time-period was chosen to determine the effects of proposed project-related traffic for the overall buildup of the site (824 DUs plus 76,500 square feet commercial).

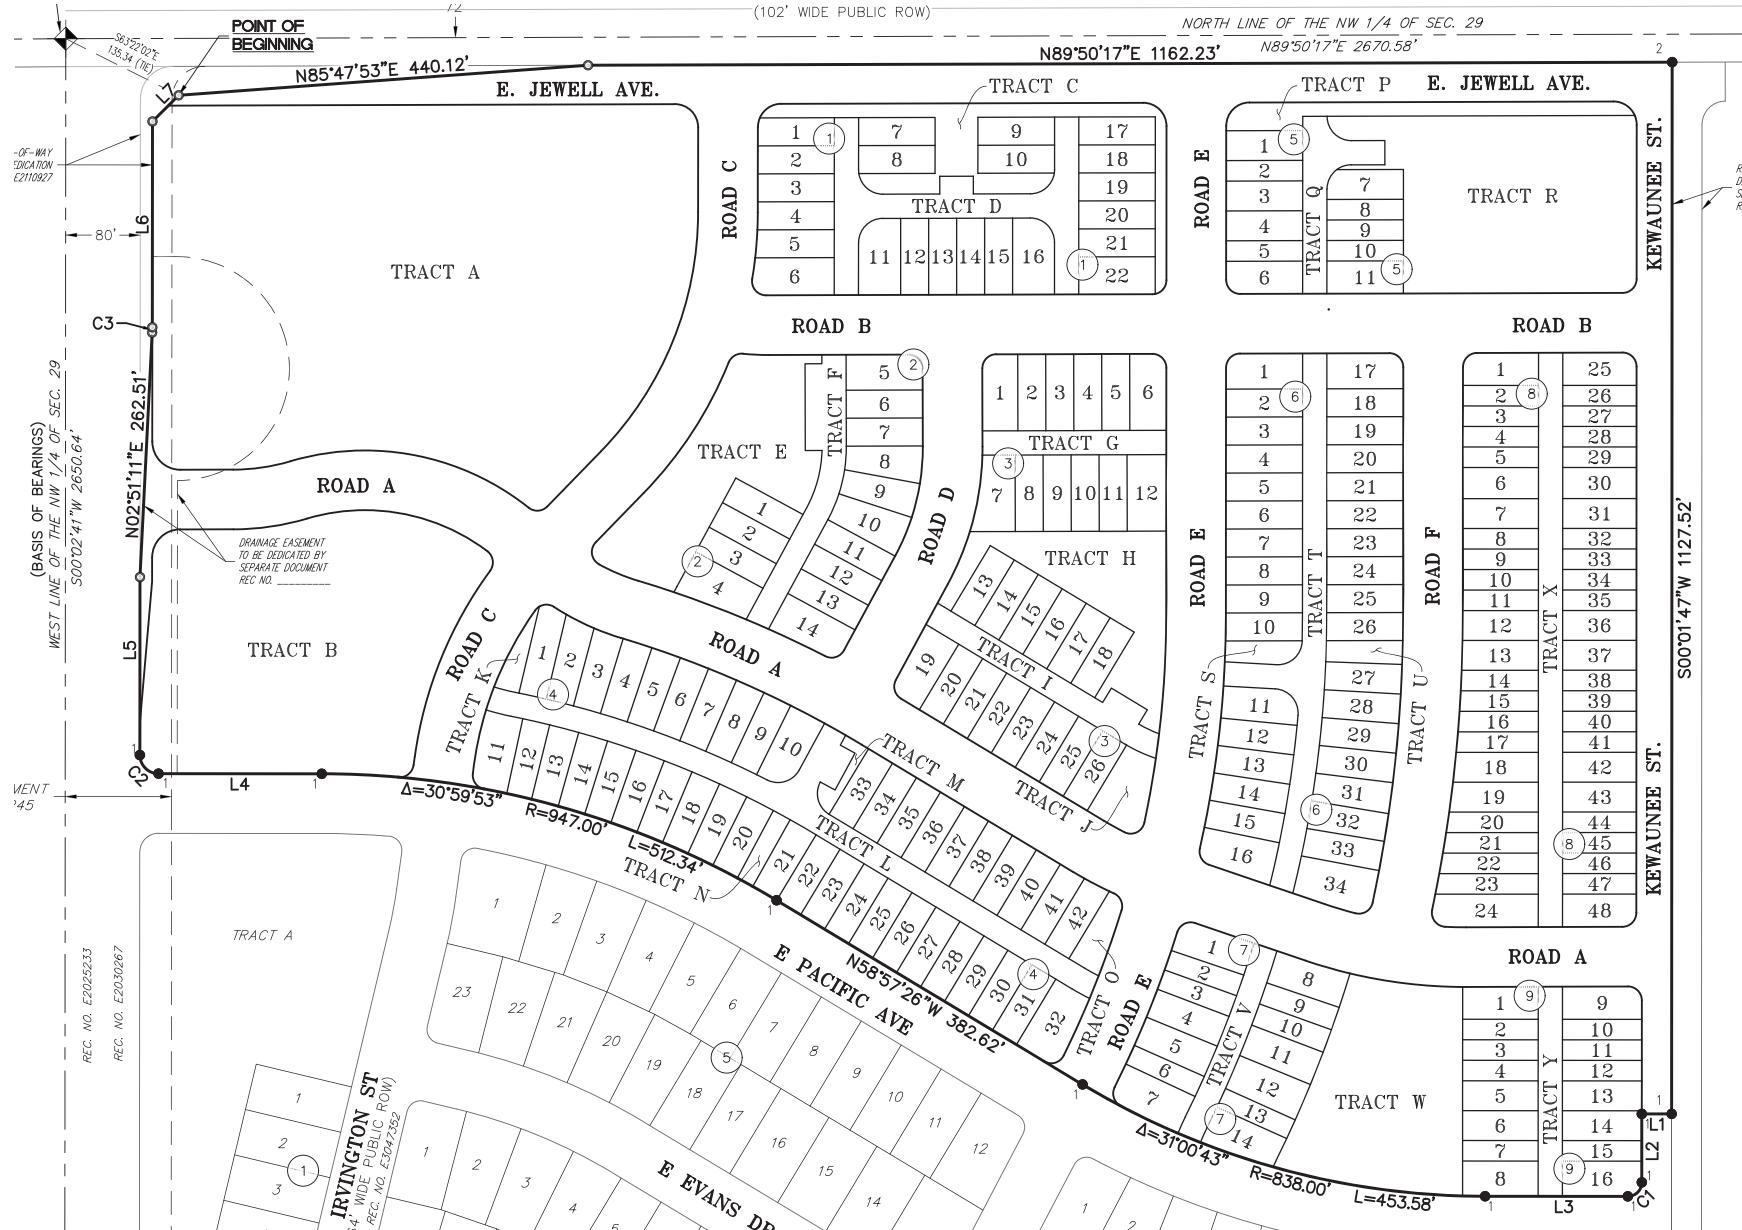

FIGURE 2
Site Plan

II. EXISTING CONDITIONS

The existing roadway network and local land uses near the proposed Harvest Crossing site are described below.

II.A. Surrounding Land Use

The area around the Harvest Crossing Filing 2 development is mostly vacant. The site is located approximately 1.5 miles east of E-470 along Jewell Ave. The anticipated Murphy Creek East development is located to the west, and the Denver Arapahoe Disposal Site (DADS) is located directly south of the site. The northern portion of the Murphy Creek East development (generally from Jewell Ave to Warren Ave north-south and between Harvest Rd and S. Flat Rock Trail east-west) has started construction and model homes are open. The roadway network required to support Harvest Crossing Filing 1 is also under construction, and site grading has begun.

II.B. Other Relevant Studies

Previous traffic analyses were identified as relevant for this evaluation:

- Felsburg Holt & Ullevig (FHU) had previously evaluated the site location for residential development in the *Villages at Murphy Creek Traffic Impact Analysis Report* dated December 2005.
- The *Murphy Creek East Traffic Impact Study* (dated March 2019) analyzed the development site directly to the west of the Harvest Crossing site. Given the lack of existing roadway network and nearby development, the Murphy Creek East study was used to provide background traffic and roadway geometry in the Harvest Crossing area, particularly along Harvest Rd.
- The *Harvest Crossing Traffic Impact Analysis* (dated August 2021) serves as the master traffic study for Harvest Crossing and also evaluated Filing 1 of the proposed development.

II.C. Transportation Network

The Harvest Crossing development site will be located southeast of the E. Jewell Ave and Harvest Rd intersection. The following roadways exist in the area today.

E. Jewell Avenue

E. Jewell Ave, generally an east-west two-lane arterial east of E-470, is the only existing roadway adjacent to the site. A 1-mile segment of E. Jewell Ave between Gun Club Rd and Harvest Rd has been improved to a 6-lane section (in accordance with NEATS), but it is currently striped as a two-lane facility east of S. Flat Rock Trail due to construction in Murphy Creek East. It remains a 2-lane roadway from that point east past the project site to Powhatan Rd. The posted speed limit is 40 miles per hour (mph).

Harvest Road

Between E. Mississippi Ave and E. Jewell Ave (north of Harvest Crossing), Harvest Rd has been constructed as a 2-lane roadway. In accordance with NEATS, this will be expanded to a 6-lane major arterial in the future. Harvest Rd is proposed as a 2-lane collector (with turn lanes) between E. Jewell Ave and E. Yale Ave (adjacent to Harvest Crossing). It is currently under construction between E. Jewell Ave and Warren Ave to provide access to Filing 1 and is planned to be extended south to Yale Ave as part of Filing 3.

II.D. Traffic Volumes

The project team collected intersection and daily counts along E. Jewell Ave in February 2020. The daily count (conducted adjacent to the site / east of Harvest Rd) indicated that E. Jewell Ave is carrying approximately 2,225 vehicles per day on a typical commuter day. At the request of City of Aurora staff, three years of background growth has been applied to these volumes using the 3.6 percent per year growth rate documented in the master traffic impact study. Hence, the volumes were increased by 11.1 percent to approximate current conditions, resulting in a daily volume of 2,475 vehicles per day along E. Jewell Ave.

The intersection traffic count was collected at the existing E. Jewell Ave / Harvest Rd intersection in 15-minute increments during the hours of 6:30 AM to 8:30 AM and from 4:00 PM to 6:00 PM. The counts were compiled and evaluated to determine peak hours. The morning peak hour was determined to be 6:45 AM to 7:45 AM, and the evening peak hour was determined to be 4:30 PM to 5:30 PM. These peak hour volumes have also been increased based on three years of background growth.

Figure 3 shows the existing traffic volumes, and **Appendix A** includes the traffic count data.

II.E. Traffic Operations

Existing operational conditions were analyzed at the existing E. Jewell Ave / Harvest Rd intersection near the project site. The analysis is based on procedures documented in the *Highway Capacity Manual*. This analysis procedure provides a Level of Service (LOS), a qualitative measure based on the average delay per vehicle at a controlled intersection described by a letter ranging from "A" to "F." LOS A represents minimal delay, while LOS F represents excessive congestion and delay. The City uses a target LOS D (indicative of an average of 35 seconds or 55 seconds [or less] of delay for vehicles passing through an unsignalized intersection or a signalized intersection, respectively) during the peak hours to determine acceptable vehicular delays. The signalized intersection analysis reports a LOS rating for the entire intersection, while the unsignalized analysis reports a movement LOS for left-turn movements and stop-controlled movements. Trafficware's Synchro traffic analysis software (Version 11.1) was used to perform the LOS calculations.

The existing conditions analysis evaluated the current intersection control. The individual movements at the unsignalized E. Jewell Ave with Harvest Rd intersection currently operate at LOS A, as shown in **Appendix B**. **Figure 3** shows existing traffic operations.

III. FUTURE ROADWAY NETWORK

As noted previously, the existing roadway network in the project area is limited. The conceptual future roadway network in the Harvest Crossing area was evaluated in the master traffic impact analysis. It examined the NEATS Refresh Study and other Aurora planning documents and traffic impact studies for nearby developments. Since the Murphy Creek East study was the most recent effort, the master traffic impact analysis maintained consistency with that report. The following sections detail internal Harvest Crossing roadways and site-related intersections (including any changes since the master traffic impact analysis).

As noted previously, Harvest Rd is anticipated to be constructed from E. Jewell Ave south to E. Yale Ave as a 2-lane collector. The northerly portion (from E. Jewell Ave to E. Warren Ave) is currently under construction and will be completed this year to provide access to Harvest Crossing Filing I. Internal roadways needed to support Filing I are also under construction, as is Kewaunee St between Warren Ave and Pacific Ave.

III.A. Filing 2

The development of Harvest Crossing Filing 2 will include a supporting roadway network that was not evaluated in detail in the master traffic impact analysis. The site plan presented on **Figure 2** shows the roadway layout. The proposed Filing 2 roadway network includes the following boundary facilities:

- E. Pacific Ave is being constructed in Filing I and forms the southern boundary of Filing 2. No changes are proposed as part of Filing 2.
- Kewaunee St is being constructed between E. Pacific Ave and E. Warren Ave as part of Filing I. Filing 2 will extend Kewaunee St north to E. Jewell Ave to form the eastern Filing 2 boundary, in accordance with the master traffic impact analysis.
- E. Jewell Ave exists today and forms the northern boundary of Filing 2. It will be widened to the south to complete the southerly half of the ultimate 6-lane cross-section in accordance with the master traffic impact analysis. The northerly half will be constructed by others.
- Harvest Rd is being constructed between E. Warren Ave and E. Jewell Ave in Filing I and forms the western boundary of Filing 2. No changes are proposed as part of Filing 2.

In addition, the following internal roadways are proposed:

- Road A is a local road that will extend east-west from Harvest Rd to Kewaunee St.
- Road B is a local road that will extend east-west from Road C (Irvington St) to Kewaunee St.
- Road C is the local road extension of Irvington St in Filing I north through Filing 2 to E. Jewell Ave.
- Road E is the local road extension of Jackson Gap St in Filing I north through Filing 2 to E. Jewell Ave. This connection was anticipated in the master traffic impact analysis.

Note: The master traffic impact analysis assumed a $\frac{3}{4}$ -movement access along E. Jewell Ave at Jackson Gap St, between Harvest Rd and Kewaunee St. Based on discussions with City staff since completion of the master traffic impact analysis, Filing 2 is now planned to have Road E (Jackson Gap St) meet E. Jewell Ave at a right-in / right-out intersection. A second full-movement access is proposed at Road C, approximately 660 feet east of Harvest Rd. This intersection may be signalized in the future if signal warrants are met.

III.B. Filing 3

Filing 3 of the development is expected to extend Harvest Rd and Kewaunee St south to Yale Ave and complete Yale Ave in accordance with the master traffic impact analysis. These connections are included in the Filing 2 long-term future analysis based on the assumptions in the master traffic impact analysis.

IV. BACKGROUND TRAFFIC CONDITIONS

Background traffic has been estimated for the short-term and long-term timeframes and accounts for existing traffic already using the transportation system, expected growth in the study area, and the addition of anticipated trips from surrounding developments. It does not include traffic generated from the Harvest Crossing Filing 2 development.

IV.A. Short-Term Background Projections and Operations

The short-term background traffic reflects traffic growth to the year 2026, which is the year that Filing 2 of the Harvest Crossing development is anticipated to be completed. In general, traffic volumes at Harvest Rd and E. Jewell Ave were estimated to increase by approximately 11 percent (3.6 percent per year) over existing conditions. In addition to the projected growth, site generated trips from the Murphy Creek developments, as well as the Harvest Crossing Filing I development, were added to the site. Harvest Crossing Filing I volumes have been distributed to the network in accordance with the short-term distribution in the approved Harvest Crossing master traffic impact analysis. **Figure 4** shows the final short-term background volumes.

The short-term background scenario would add several intersections to the study area, in addition to the existing Jewell Ave & Harvest Rd intersection. The anticipated roadway geometry used at each intersection is based on the master traffic impact analysis and is described as follows:

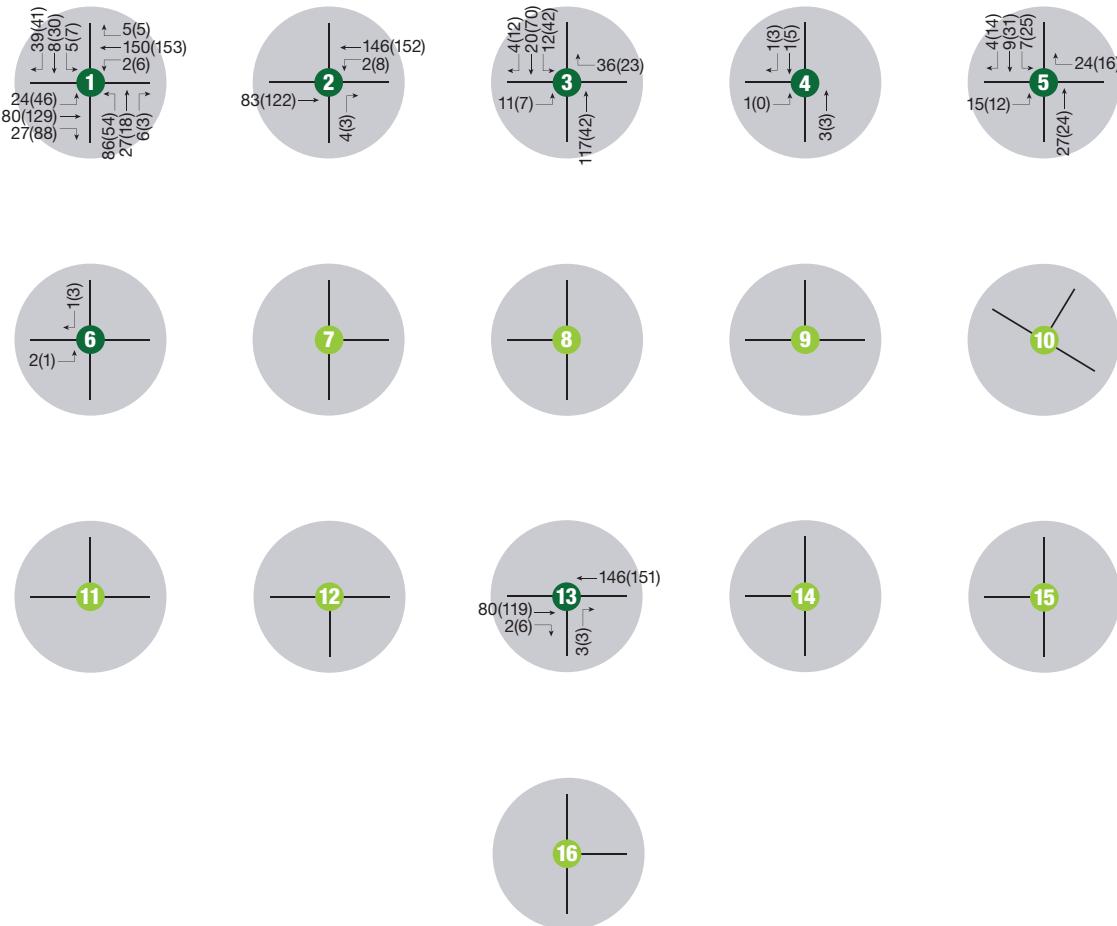

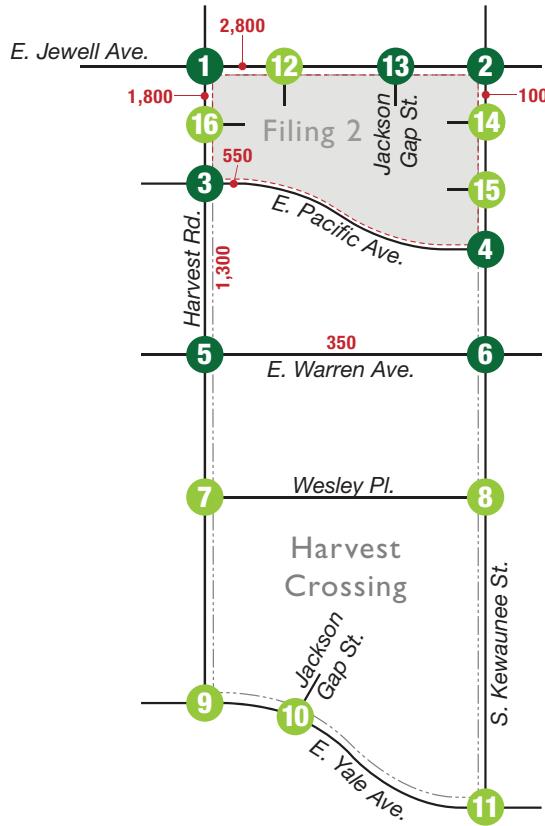

- **E. Jewell Ave & Harvest Rd** is an unsignalized four-leg intersection with two-way stop control on the north-south approaches. The southbound and westbound approaches each have one shared left/through/right lane, while the eastbound approach has an exclusive left turn lane and the northbound approach has both an exclusive left and right turn lane. Note: The eastbound approach has been built to its final 6-lane cross-section as part of Murphy Creek. Since the roadway to the east is not assumed to be complete in the Harvest Crossing short-term background scenario, single eastbound and westbound through lanes have been assumed. Further, due to a significant reduction in commercial square footage from the master study, the northbound approach has been reduced from double left turn lanes to a single left turn lane.
- **Harvest Rd & Pacific Dr** is an unsignalized four-leg intersection with two-way stop control on the east and west approaches. The east and westbound approaches share a single lane for all movements, while the north and southbound approaches each have an exclusive left turn lane.
- **Harvest Rd & Warren Ave** is an unsignalized four-leg intersection with two-way stop control on the east and west approaches. The east and westbound approaches share a single lane for all movements, while the north and southbound approaches each have an exclusive left turn lane.

Although Kewaunee St will be constructed between E. Pacific Ave and E. Jewell Ave as part of Filing 2, some background traffic from Filing I will use this connection once it is opened. Hence, it is included in the short-term background analysis to appropriately reflect Filing I trips. Similarly, Jackson Gap Street will be built with Filing 2, but has been included in the background to accurately reflect Filing I trips.

- **E Jewell Ave & Kewaunee St** is an unsignalized three leg intersection with a stop sign on the northbound approach. All approaches are assumed to have one shared lane for each movement.
- **Kewaunee & Pacific Ave** is an unsignalized T intersection with all approaches sharing a single lane.
- **Kewaunee St & Warren Ave** is an unsignalized three leg intersection with each approach sharing a single lane.

Figure 5 presents the intersection operational results for the short-term background traffic projections. The individual movements at the unsignalized intersections all operate at LOS C or better.

Harvest Crossing - Filing 2 UPDATE 124044-01 4/11/24

IV.B. Long-Term Background Projections and Operations

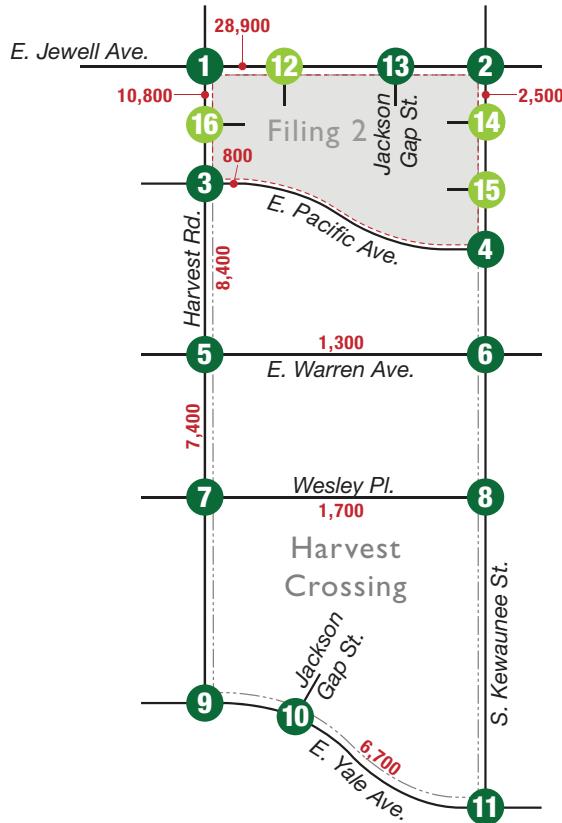

The long-term background traffic reflects traffic growth to the year 2040. The full buildout of the Harvest Crossing development is anticipated to be completed before 2040. Background volumes were extracted from the Harvest Crossing master traffic impact analysis, and then site generated trips from Murphy Creek East, Harvest Crossing Filing 1, and Harvest Crossing Filing 3 were added to represent projected 2040 conditions. The long-term background volumes are shown on **Figure 6**.

Similar to the short-term condition, both Filing 1 and Filing 3 volumes have been distributed through the network in accordance with the long-term distribution in the approved Harvest Crossing master traffic impact analysis.

The anticipated long-term background geometry used at the intersections along Harvest Rd south of Jewell Avenue was obtained from the master traffic impact analysis. Kewaunee St was assumed to be a 2-lane local street per the master traffic impact analysis. The various long-term geometric conditions are described as follows:

- **E. Jewell Ave and Harvest Rd** is a signalized four-leg intersection with the following geometry. The eastbound approach has two left turn lanes, two thru lanes, and a shared thru/right lane. The westbound approach has one left turn lane, three thru lanes, and a right turn lane. The northbound approach has a left turn lane, a thru lane, and a right turn lane. The southbound approach has two left turn lanes, a thru lane, and a right turn lane. It should be noted that due to a significant reduction in commercial square footage from the master study, the northbound approach has been reduced from double left turn lanes to a single left turn lane.
- **Harvest Rd and Pacific Dr** is an unsignalized four-leg intersection with two-way stop control on the east and west approaches. All approaches have a single left/thru/right lane.
- **Harvest Rd and Warren Ave** is an unsignalized four-leg intersection with two-way stop control on the east and west approaches. All approaches have a single left/thru/right lane.
- **Kewaunee St and Warren Ave** is an unsignalized four-leg intersection with two-way stop control on the east and west approaches. The easterly leg is anticipated to serve the undefined development east of Harvest Crossing. All approaches have a single left/thru/right lane.
- **Harvest Rd and Wesley Pl** is an unsignalized four-leg intersection with two-way stop control on the east and west approaches. All approaches have a single left/thru/right lane.
- **Kewaunee St and Wesley Pl** is an unsignalized three-leg intersection with two-way stop control on the west approach. All approaches have a single left/thru/right lane.
- **Harvest Rd and E. Yale Ave** is a three-leg single-lane roundabout. West of Harvest Rd, E. Yale Ave is anticipated to connect to Gun Club Rd, increasing volumes along E. Yale Ave and driving the need for the roundabout.
- **Jackson Gap St and E. Yale Ave** is an unsignalized three-leg intersection with side street stop control on the Jackson Gap St approach. All approaches have one lane for all movements.
- **Kewaunee St and E. Yale Ave** is an unsignalized three-leg intersection with side street stop control on the Kewaunee St approach. All approaches have one lane for all movements.
- **E. Jewell Ave and Kewaunee St** is a signalized four-leg intersection with the following geometry. The eastbound approach has one left turn lane, two thru lanes, and a shared thru/right turn lane. The westbound approach has one left turn lane, two thru lanes, and a shared thru/right turn lane. The northbound approach has a left turn lane, two thru lanes, and a shared thru/right turn lane. The southbound approach has a left turn lane and a shared thru/right lane.

KEY MAP

LEGEND

- XXX(XXX) = AM(PM) Peak Hour Traffic Volumes
- XXXX = Daily Traffic Volumes
- X = Future Intersection

NOTE: Drawing Not to Scale

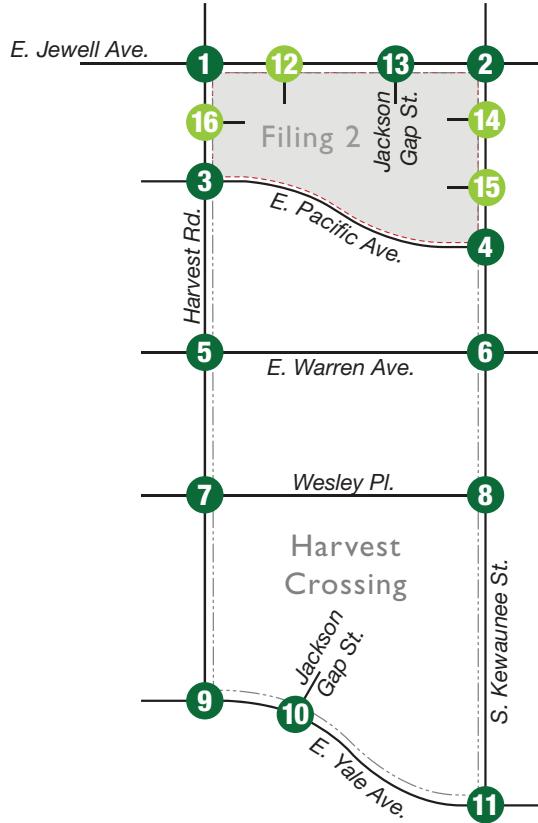

Figure 7 presents the intersection operational results for the long-term background traffic projections. Note: The intersections of Jewell Ave with Harvest Rd and Kewaunee St are assumed to be signalized by the long-term scenario. Further detail of the signal warrant analyses is contained in the following section. All of the intersections, both signalized and unsignalized, evaluated in this study operate at or above City LOS standards in the long-term background scenario. **Appendix E** summarizes the short-term and long-term background LOS results.

Traffic Signalization Warrant Analyses – Long-Term

The *Manual on Uniform Traffic Control Devices* (MUTCD) identifies eight warrants that provide guidance to determine whether installation of a traffic signal is justified. Some of these warrants are based on traffic volume levels, while others are based on the accident history of an intersection or whether the intersection is a designated school crossing. The master traffic impact analysis conducted a long-term scenario warrant analysis and recommends monitoring this location for signalization between the short-term and long-term scenarios.

Based on the volumes calculated herein, the intersections of Jewell Ave with Kewaunee St and Harvest Rd would meet the eight-hour volume, four-hour volume, and peak hour volume warrants by the long-term background scenario. **Appendix E** contains signal warrant analysis results.

FIGURE 7

Long Term (2040) Background
Lane Geometry and Level of Service

Harvest Crossing - Filing 2 UPDATE 124044-01 4/11/24

V. PROJECTED CONDITIONS

The proposed Harvest Crossing development will consist of residential and commercial land uses. The following subsections describe the proposed development and how it is anticipated to interact with the adjacent street network.

V.A. Site Trip Generation

The number of vehicle-trips that will be generated by the proposed development was forecast based on trip rates and procedures documented in *Trip Generation* (Institute of Transportation Engineers, 11th Edition, 2021). The categories used in this analysis include Single Family Detached Housing (ITE land use code 210), Single Family Attached Housing (ITE Land Use Code 215), and two shopping center categories (ITE land use codes 821 and 822). Land use code 821 is used for small shopping plazas of 40k sf to 150k sf; whereas land use code 822 is used for small strip plazas of less than 40k sf.

Table 1 summarizes the trip generation rates, and **Table 2** includes trip generation estimates by phases developed for purposes of traffic assignment.

Table 1. Trip Generation Rates

Land Use	LUC Code	Daily	AM	Distribution	PM	Distribution
Single Family Detached	210	$T = X * 9.43$	$T = X * 0.7$	In: 25%	$T = X * 0.94$	In: 63%
				Out: 75%		Out: 37%
Single Family Attached	215	$T = X * 7.2$	$T = X * 0.48$	In: 25%	$T = X * 0.57$	In: 59%
				Out: 75%		Out: 41%
Shopping Plaza	821	$T = X * 67.52$	$T = X * 1.73$	In: 62%	$T = X * 5.19$	In: 49%
				Out: 38%		Out: 51%
Strip Retail Plaza	822	$T = X * 54.45$	$T = X * 2.36$	In: 60%	$T = X * 6.59$	In: 50%
				Out: 40%		Out: 50%

Filing 2 is anticipated to include 138 single family detached DUs, 89 single family attached DUs, and 76,500 square feet of commercial space, with 54,500 square feet in Tract A and 22,000 square feet in Tract B. It should be noted that for a conservative estimate within this study, 140 single family detached and 90 single family attached dwelling units were used for analyses. The total buildout scenario includes 824 single family detached DUs and 76,500 square feet of commercial land use. Although limited internal capture may occur between some commercial land uses and residential units, this study did not adjust trips for internal capture as the nature of the commercial land use is unknown. Similarly, no pass-by trip credits were taken for the commercial area due to the unknown nature of the commercial land use.

In total, the entire Harvest Crossing development is estimated to generate approximately 703 trips during the AM peak hour, 1,168 trips during the PM peak hour, and 1,2446 trips per day. This represents a reduction of overall trips from the master traffic impact analysis. The reduction is due to the changes in land uses (and particularly a reduction in commercial space) and minor changes in ITE trip generation rates between the 10th Edition and the 11th Edition. Of these trips, the Filing 2 development is anticipated to contribute 288 trips in the AM, 610 trips in the PM, and 6,846 trips per day. Filing 2 contributes approximately 41 to 55 percent of the overall Harvest Crossing trips generated.

Table 2. Trip Generation Estimates

	Land Use	LUC Code	Quantity	Units	Daily Trips	AM Peak Hour Trips*			PM Peak Hour Trips*			
						In	Out	Total	In	Out	Total	
Filing 1	Single Family Detached	210	145	DU	1,367	25	76	101	86	51	137	
	Background Trips					1,367	25	76	101	86	51	137
Filing 2	Single Family Detached (north of Pacific)	210	140	DU	1,320	25	74	99	83	49	132	
	Single Family Attached	215	90	DU	648	11	32	43	30	21	51	
	Commercial (north of Pacific)	821	54.5	KSF	3,680	58	36	94	139	144	283	
		822	22	KSF	1,198	31	21	52	72	72	144	
	Filing 2 Trips					6,846	125	163	288	324	286	610
	Total Trips (Short-Term)					8,213	150	239	389	410	337	747
Filing 3	Single Family Detached (south of Warren)	210	449	DU	4,233	79	235	314	266	155	421	
	Trips from Future Phases					4,233	79	235	314	266	155	421
	Total Trips (Long-Term)					12,446	229	474	703	676	492	1,168

*Peak hour trips were calculated using the 11th edition of the ITE *Trip Generation Manual* and are based on peak hour of adjacent street.

V.B. Trip Distribution and Traffic Assignment

The external trips generated by the site were assigned to the study area roadway network using percentages of trips expected to travel in different directions to/from the site. Trip distribution percentages were carried forward from the master traffic impact analysis. The distributions differed for short-term and long-term given the development of the roadway network timelines associated with each phase of development. Directional distributions for site-generated trips are illustrated on **Figure 8** and **Figure 9** and are described as follows:

Short-Term

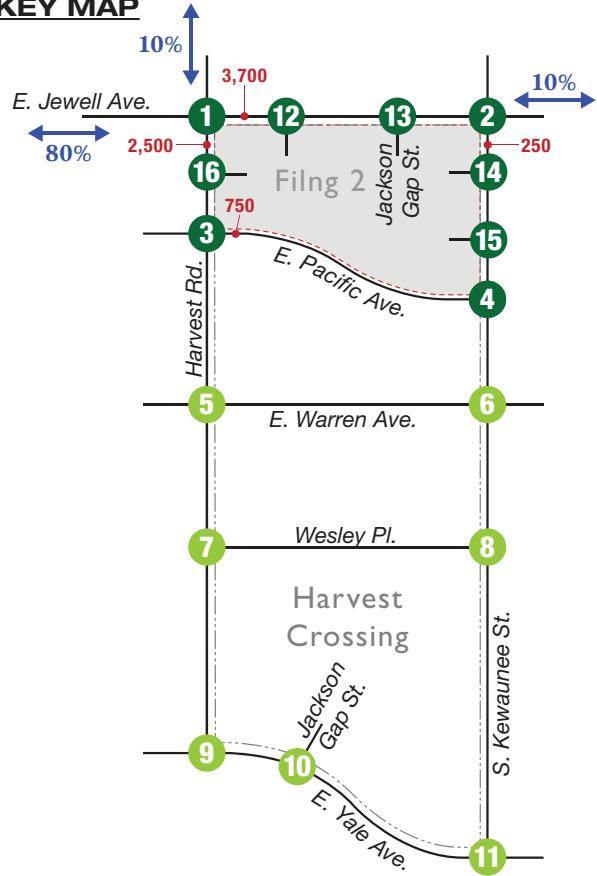

- 80 percent to/from the west on E. Jewell Ave (west of Harvest Rd)
- 10 percent to/from the east on E. Jewell Ave (east of Kewaunee St)
- 10 percent to/from the north on Harvest Rd (north of E. Jewell Ave)

Long-Term

- 40 percent to/from the west on E. Jewell Ave (west of Harvest Rd)
- 15 percent to/from the north on Harvest Rd (north of E. Jewell Ave)
- 15 percent to/from the west on Yale Ave (west of Harvest Rd)
- 10 percent to/from the east on E. Jewell Ave (east of Kewaunee St)
- 5 percent to/from the north on Kewaunee St (north of E. Jewell Ave)
- 5 percent to/from the east on Yale Ave (east of Kewaunee St)

The peak hour site generated traffic volumes were assigned to the roadway network and site access points based on these trip distribution percentages. **Figure 8** and **Figure 9** show the trip distribution and the estimated site generated traffic for the proposed development for both planning horizons.

VI. TOTAL TRAFFIC CONDITIONS

The external site generated traffic was added to the short-term (2026) and long-term background (2040) volumes to develop total traffic volumes. These total traffic scenarios were then evaluated to determine LOS and project-related operational affects. LOS worksheets are shown in **Appendix D**.

VI.A. Short-Term Total Projections and Operations

The short-term total traffic reflects traffic estimates for the short-term timeframe (year 2026), including short-term background traffic and trips generated from the Harvest Crossing Filing 2 development. These volumes are shown on **Figure 10**.

Figure 11 presents the intersection operational results for the short-term total traffic projections. All signalized intersections and unsignalized movements are projected to operate at LOS D or better. It should be noted that the intersection of Jewell Ave with Harvest Rd is anticipated to meet signal warrants by this timeframe and should be monitored for signalization. The following section details the signal warrant analysis.

Traffic Signalization Warrant Analyses – Short-Term

The master traffic impact analysis assumed a signal would be warranted by 2040 at the intersection of E. Jewell Ave and Harvest Rd and recommends monitoring this location for signalization between the short-term and long-term scenarios. Based on the volumes calculated herein, this intersection would meet the eight-hour volume, four-hour volume, and peak hour volume warrants by the short-term total scenario. Further, it is anticipated that intersection 12, Jewell Avenue with Irvington Street, would warrant signalization with development to the north; however, volume associated with this development are not anticipated to warrant signalization at this intersection. **Appendix E** contains signal warrant analysis results.

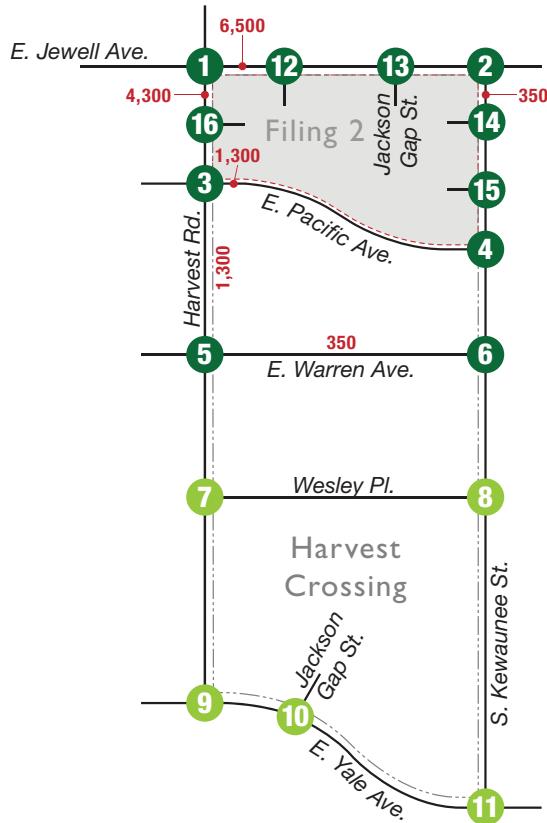

Internal Intersection Controls – Short-Term

The local street network internal to the Filing 2 site was not analyzed for operations. The peak hour volumes are very low (typically less than 100 vehicles per hour), which is normal for local residential streets within subdivisions. The following intersection controls are assumed based on internal connectivity and geometric layouts:

- Stop control for S Irvington St approaching Pacific Ave and Jewell Ave
- Stop control for Jackson Gap St approaching E. Pacific Ave and Jewell Ave
- Stop control for northern site access approaching Irvington St, Jackson Gap St, and Kewaunee St
- Stop control for southern site access approaching Irvington St, Jackson Gap St, and Kewaunee St
- Stop control for southern site access right in/right out approaching Harvest Rd

No turn lanes are assumed at these internal intersections.

VI.B. Long-Term Total Projections and Operations

The long-term total traffic reflects traffic estimates for the long-term timeframe (year 2040), including long-term background traffic and trips generated from the Harvest Crossing Filing 2 development. These volumes are shown on **Figure 12**. It should be noted that a large reduction in the commercial square footage of this development has led to reduced trips and laneage at the northbound approach at the intersection of Harvest Road with Jewell Avenue.

Figure 13 presents the intersection operational results for the long-term total traffic projections. The individual movements and overall intersection operations are projected to operate with acceptable LOS (LOS D and better) with the exception of the following:

Harvest Road & Pacific Avenue

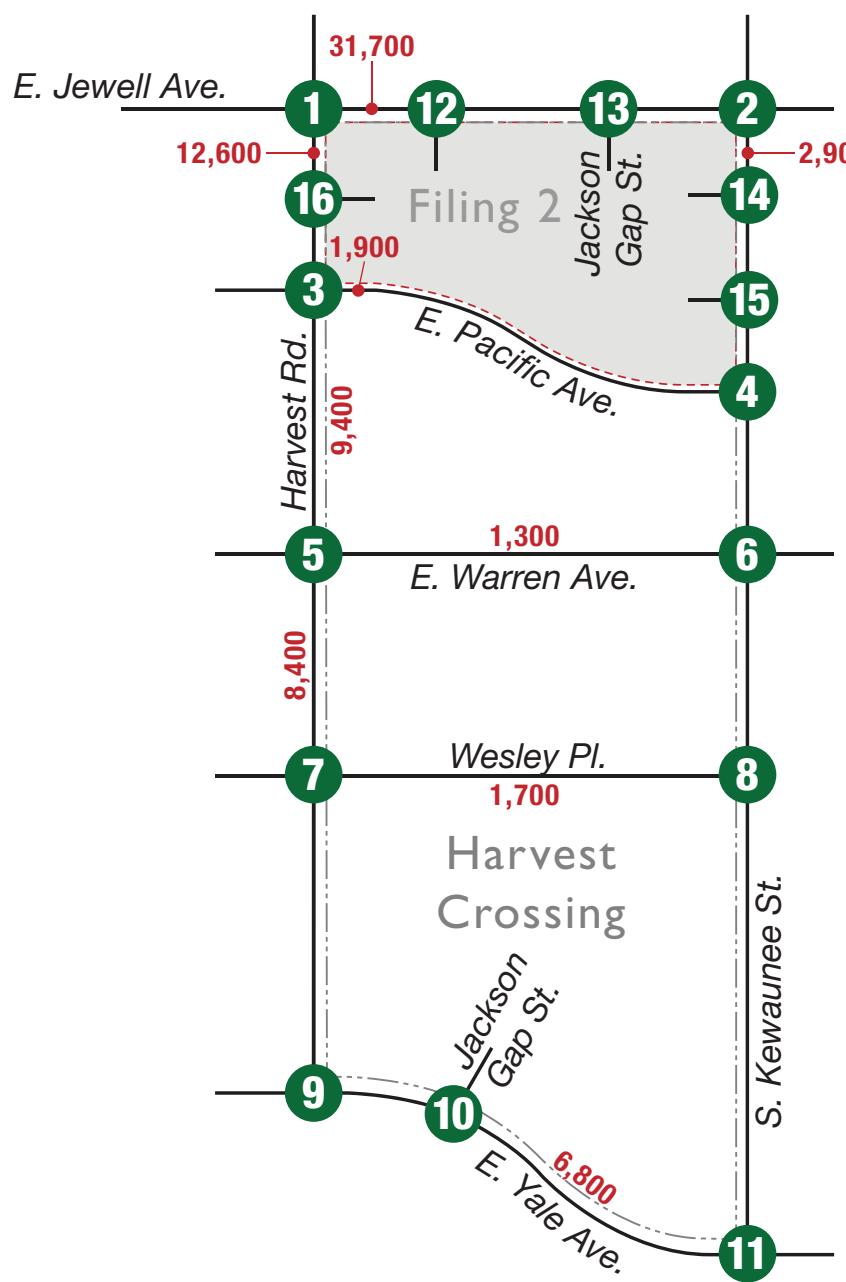

- The eastbound left turn operates at LOS E in the PM peak hour.
- The westbound left turn operates at LOS F in the PM peak hour.

Harvest Road / Warren Avenue

- The eastbound left turn operates at LOS E in the PM peak hour.

Note: These operational analyses assumed signalization of the intersection of Jewell Ave with Kewaunee St and Harvest Rd as outlined in the long-term background condition. **Appendix F** summarizes all study intersections and the anticipated LOS results for both the short- and long-term scenarios. **Appendix D** contains LOS worksheets for both the short- and long-term scenarios.

Other Mitigations

Signalization of the E. Jewell Ave / Harvest Rd intersection will address identified operational issues at that location. The signal is reasonably anticipated in Aurora's long-range planning efforts and is shown to be warranted in the master traffic impact analysis. The remaining operational issues are addressed as follows:

- The eastbound and westbound left-turn movements at the Pacific Ave / Harvest Rd intersection are expected to operate at LOS E and LOS F during the PM peak hour, respectively. The left turn volumes are low (less than 40 vehicles per hour in both peak periods), and the left turns operate from exclusive lanes. The recommended storage length for both the eastbound and westbound approach is 50 feet. This is not anticipated to interfere with nearby internal intersections. The poorly operating left-turn condition is common for left-turn movements from side streets onto collector roadways. Hence, no mitigations have been proposed.
- The eastbound left-turn movement at the Warren Ave / Harvest Rd intersection is expected to operate at LOS E during the PM peak hour. The left turn volumes are low at 16 vehicles per hour, and the left turn operates from an exclusive lane. The recommended storage length for this movement is 50 feet. This is not anticipated to interfere with nearby internal intersections. The poorly operating left-turn condition is common for left-turn movements from side streets onto collector roadways. Hence, no mitigations have been proposed.
- The E. Jewell Ave / Road C (Irvington St) intersection does not meet signal warrants solely with Harvest Crossing traffic. It is anticipated that future development north of E. Jewell Ave will eventually result in a signal being warranted at this location. Hence, it should be monitored for signalization.
- The E. Jewell Ave / Kewaunee St intersection does not meet signal warrants solely with Harvest Crossing traffic. It is anticipated that future development north of E. Jewell Ave and east of Kewaunee St will eventually result in a signal being warranted at this location. Hence, it should also be monitored for signalization.

Auxiliary Lane Requirements

Auxiliary lanes were evaluated using two methodologies. First, 95th percentile queues were extracted directly from the project's Synchro software analyses. These queue lengths are based on projected operating conditions (including heavy vehicles, opposing traffic flows, and signal timings). Second, City of Aurora *Traffic Impact Study Guidelines* indicate that the Colorado Department of Transportation's State Highway Access Code (SHAC) should be used to determine storage and taper lengths. However, the SHAC procedures do not account for other conditions in the intersection such as low opposing through movements if a left-turn movement is in question. The project team evaluated these two sets of results to develop ultimate recommendations for auxiliary lanes. These recommendations for vehicle storage lengths (in feet) are presented in **Table 3** for use in identifying construction needs for Harvest Crossing.

Output from the traffic analysis effort was used to recommend these storage lengths, using the following methodology:

- **Left turn lane storage lengths.** At signalized intersections, the greater of the HCM 6th Edition or Synchro methodology queue calculations were reported. For unsignalized intersections, the HCM 6th Edition calculation was reported.
- **Through movements.** For signalized intersections, Synchro calculation results were reported. No through movement queues are reported for unsignalized intersections as the through movements are free flowing.
- **Right turn movements.** The Synchro queue length was used. HCM 6th Edition information was not used because HCM's signalized intersection methodology does not account for right turns on red.

The first column of queue lengths presented in **Table 3** is the long-term 95th percentile queue length results from Synchro/HCM, rounded up to the nearest 25 feet. These are shown for both AM and PM peak hours to account for directionality of traffic flows. These values are presented for all turn lanes included in the study except two-way left turn lanes. Generally, the higher of these two values is used for the storage length.

The second column of queue lengths presented in **Table 3** is the storage length recommendations from the SHAC. As noted previously, SHAC requirements are based on assumed arterial conditions. Hence, they have been applied to only the collector and arterial roadways, not local roadways. It was assumed E. Jewell Ave is classified as a NR-B Regional Highway operating at 40 mph adjacent to the project site, where a 12:1 transition taper ratio + storage length would be required. SHAC requirements for NR-C Arterials were applied to Harvest Rd, Yale Ave, and Warren Ave, and the operating speed was assumed to be 30 mph, where an 8:1 transition taper ratio + storage length would be required. The results of this evaluation are summarized in **Table 3**.

The final column in **Table 3** provides recommended auxiliary lane lengths along study area roadways based on results from both the 95th percentile and SHAC evaluations.

VII. SUMMARY AND RECOMMENDATIONS

Harvest Crossing is a planned development encompassing approximately 200 acres in Aurora, Colorado. The site is located in the southeast quadrant of the Harvest Rd / E. Jewell Ave intersection and is directly east of the Murphy Creek East development. The proposed land uses include 145 single family dwelling units in Filing 1 and 260 single family dwelling units in Filing 2 (year 2026). The total buildout of 824 single family dwelling units and 76,500 square feet of commercial space is expected by 2040. The total buildout of the development is estimated to generate approximately 12,930 daily vehicle-trips per day.

Roadway classifications were based on the approved Harvest Crossing master traffic impact analysis. Traffic signals are anticipated to be installed at the major intersections, including:

- **E. Jewell Ave & Harvest Rd**, which is anticipated to meet warrants between 2025 and 2040. The developer should anticipate a 25 percent contribution to the signal construction at this location. It should be noted that, due to a significant reduction in commercial square footage from the master study, the northbound approach at this intersection has been reduced from a double to a single left turn lane.
- **E. Jewell Ave & Road C (Irvington St)**, which is anticipated to meet warrants when development north of Harvest Crossing begins to occur. This development is currently unknown and was not analyzed in this study. This study shows acceptable operations with minor street stop control; however, when development to the north occurs, the developer should anticipate a 50 percent contribution to the eventual signal construction at this location.
- **E. Jewell Ave & Kewaunee St**, which is anticipated to meet warrants when development north and east of Harvest Crossing begins to occur. The developer should anticipate a 25 percent contribution to the eventual signal construction at this location.

Most of the studied intersections operate at LOS D or better in the short-term and long-term total traffic scenarios. The individual movements at the unsignalized intersection operate with acceptable LOS (LOS D and better) except for the following:

- Harvest Rd / Pacific Ave
 - The eastbound left-turn operates at LOS E in the PM peak hour.
 - The westbound left-turn operates at LOS F in the PM peak hour.
- Harvest Rd / Warren Ave
 - The eastbound left-turn operates at LOS E in the PM peak hour.

The study has also demonstrated that two means of egress can be provided during both Filing 2 and full buildout scenarios.

Intersection Summary

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.66

Intersection Signal Delay: 9.6

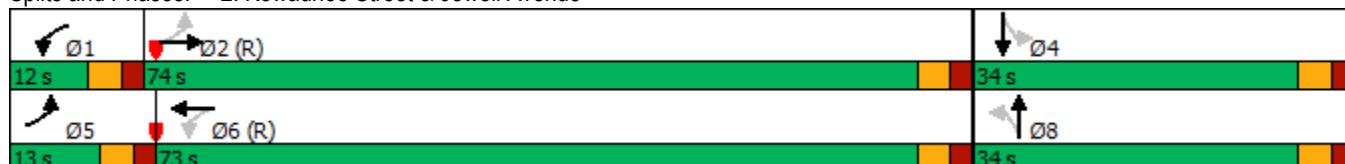

Intersection LOS: A

Intersection Capacity Utilization 47.2%

ICU Level of Service A

Analysis Period (min) 15

Splits and Phases: 2: Keweenaw Street & Jewell Avenue

HCM 6th Signalized Intersection Summary
2: Kewaunee Street & Jewell Avenue

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Timings
1: Harvest Road & Jewell Avenue

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
