I. INTRODUCTION

I.A Summary

Green Valley Ranch East Filing 10 consists of 180 single family units, which includes 82 single-family detached and 98 single-family attached (duplex), to be developed within the Green Valley Ranch East master plan. As shown on **Figure 1**, the site is located in the southwest quadrant of the future 48th Avenue and Tibet Road intersection in Aurora, Colorado.

Figure 2 depicts the current site plan concept. As shown, Filing 10 would have vehicular access via two access points: one full access onto Tibet Road via 46th Avenue and one right-in right-out (RIRO) access onto 48th Avenue. It is anticipated that the full buildout of the site would be completed in 2026.

Three previous reports have addressed the traffic aspects of development in this area of Green Valley Ranch East:

- ▶ *Transportation Analysis, Green Valley Ranch East, Felsburg Holt & Ullevig, July 2018*
- ▶ *Green Valley Ranch East CSP I, Active Adult Residential, Traffic Impact Study, Felsburg Holt & Ullevig, updated May 28, 2020*
- ▶ *Windler Master Traffic Impact Study, Felsburg Holt & Ullevig, July 2023*

The current Filing 10 development proposal is in general conformance with the planning data previously used for the 2018 *Transportation Analysis, Green Valley Ranch East* report (the FDP report). The purpose of this current traffic study is to identify the potential impacts specific to Filing 10 to determine the resultant roadway and traffic control improvements required. Both Short-Term (2026) and Long-Term (2045) planning horizons were evaluated.

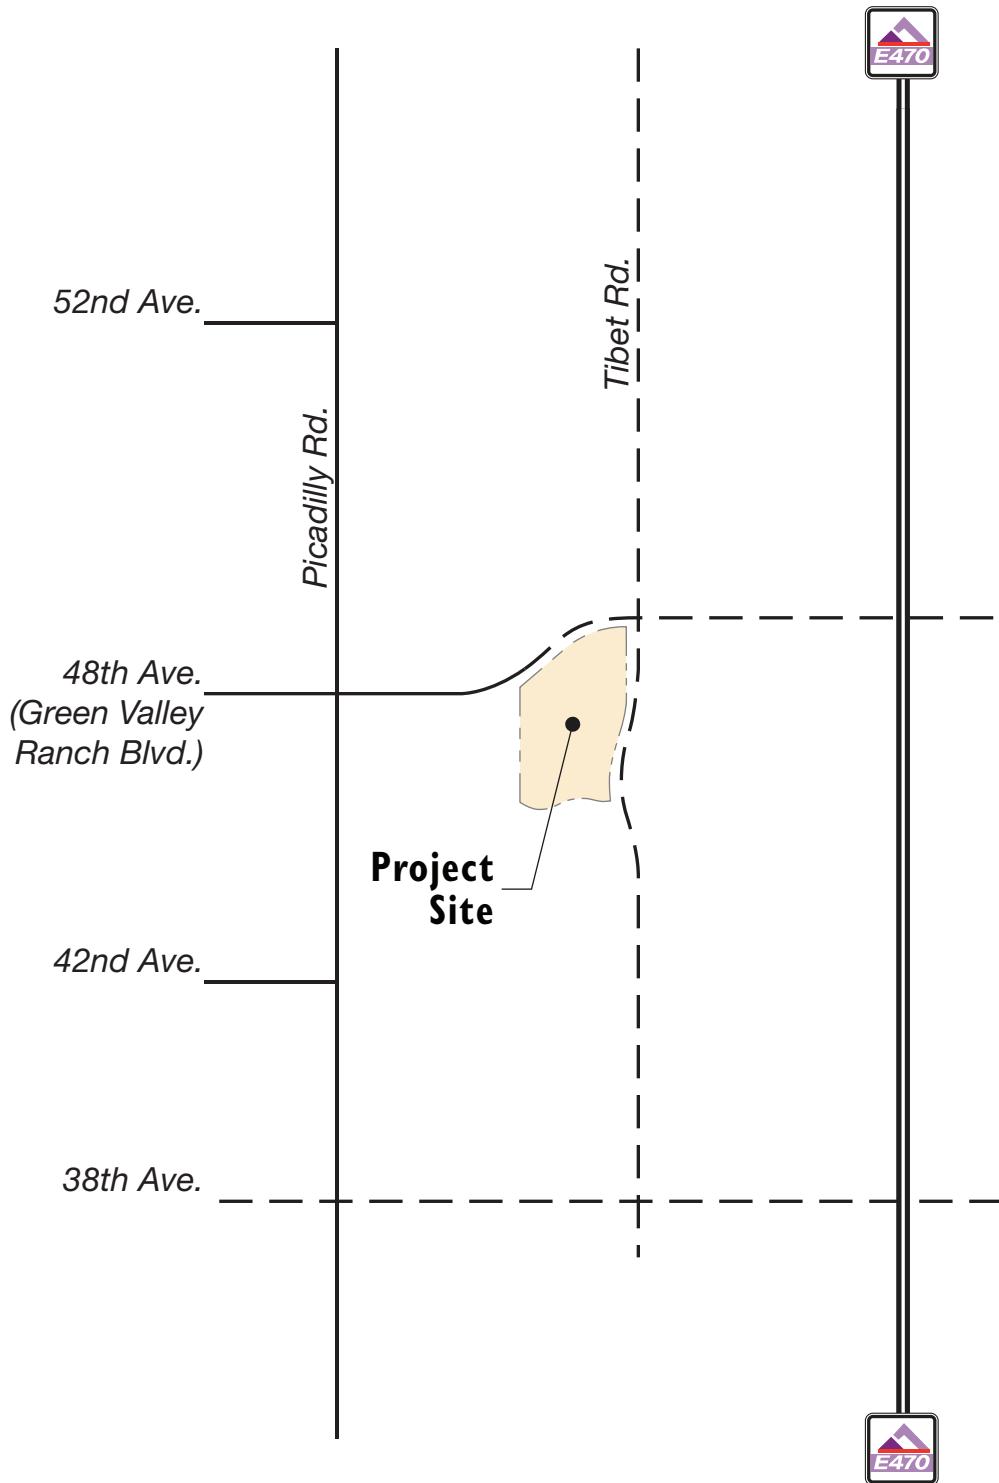

I.B Scope of Services

The purpose of this Traffic Impact Study (TIS) is to estimate the potential impacts specific to the proposed development and to identify any resultant required roadway and/or intersection improvements and traffic control needs. This TIS also includes an auxiliary turn lane analysis, a queueing analysis, and a Manual on Uniform Traffic Control Devices (MUTCD) control device warrant evaluation for study intersections. The primary focus for traffic operations is at the following intersections:

- ▶ 48th Avenue & Tibet Road
- ▶ 48th Avenue & Site Drive #1 (RIRO Access)
- ▶ 46th Avenue & Tibet Road

The study will evaluate the following time periods:

- ▶ Short-Term Background (2026) AM and PM peak hours
- ▶ Long-Term Background (2045) AM and PM peak hours
- ▶ Short-Term Total (2026) of the development for AM and PM peak hours
- ▶ Long-Term Total (2045) of the development for AM and PM peak hours

II. TRAVEL DEMAND AND FUTURE GROWTH

II.A Site Trip Generation

Land use and number of lots were based on the site plan provided by Terracina Design. The proposed development is anticipated to contain single-family housing. Trip generation from the *Institute of Transportation Engineers' (ITE) Trip Generation Manual, Eleventh Edition, 2021*, was used to estimate the traffic generated by the site. NOTE: A mix of average rates and equation rates were used from the ITE *Trip Generation Manual* based on the methodology outlined in *ITE Trip Generation Handbook, 3rd Edition, 2017*, for selecting the proper rates. study. **Table I** shows the trip generation rates and equations for the single-family detached housing (210) and single-family attached housing (215) based on the independent variables of dwelling units (DUs).

Table I. ITE Trip Generation Rates and Equations

ITE Code	Land Use Description	Size	Unit	Daily Total	Peak Hour	Equations and Rates		Distributions	
						In	Out	In	Out
210	Single-Family Detached Housing	82	DU	$\text{Ln}(T)=0.92*\text{LN}(X)+2.68$	AM	$\text{Ln}(T)=0.91*\text{Ln}(X)+0.12$	25%	75%	
					PM	$\text{Ln}(T)=0.94*\text{Ln}(X)+0.27$	63%	37%	
215	Single-Family Attached Housing	98	DU	$T=7.62*(X)-50.48$	AM	$T = 0.52*(X) - 5.70$	25%	75%	
					PM	$T = 0.60*(X) - 3.93$	59%	41%	

Table 2 shows the total trip generation estimates for full buildout of the development. As shown, with the internal trip capture determined, the full buildout of the development is estimated to generate 1,537 daily vehicle-trips to the roadway network, including 107 vehicle-trips during the AM and 137 vehicle-trips during the PM peak.

Table 2. Site Trip Generation Estimate

ITE Code	Land Use Description	Size	Unit	Daily Total	AM Peak Hour			PM Peak Hour		
					In	Out	Total	In	Out	Total
210	Single-Family Detached Housing	82	DU	841	16	47	62	52	30	82
215	Single-Family Attached Housing	98	DU	696	11	34	45	32	23	55
Project Total				1,537	27	81	107	84	53	137

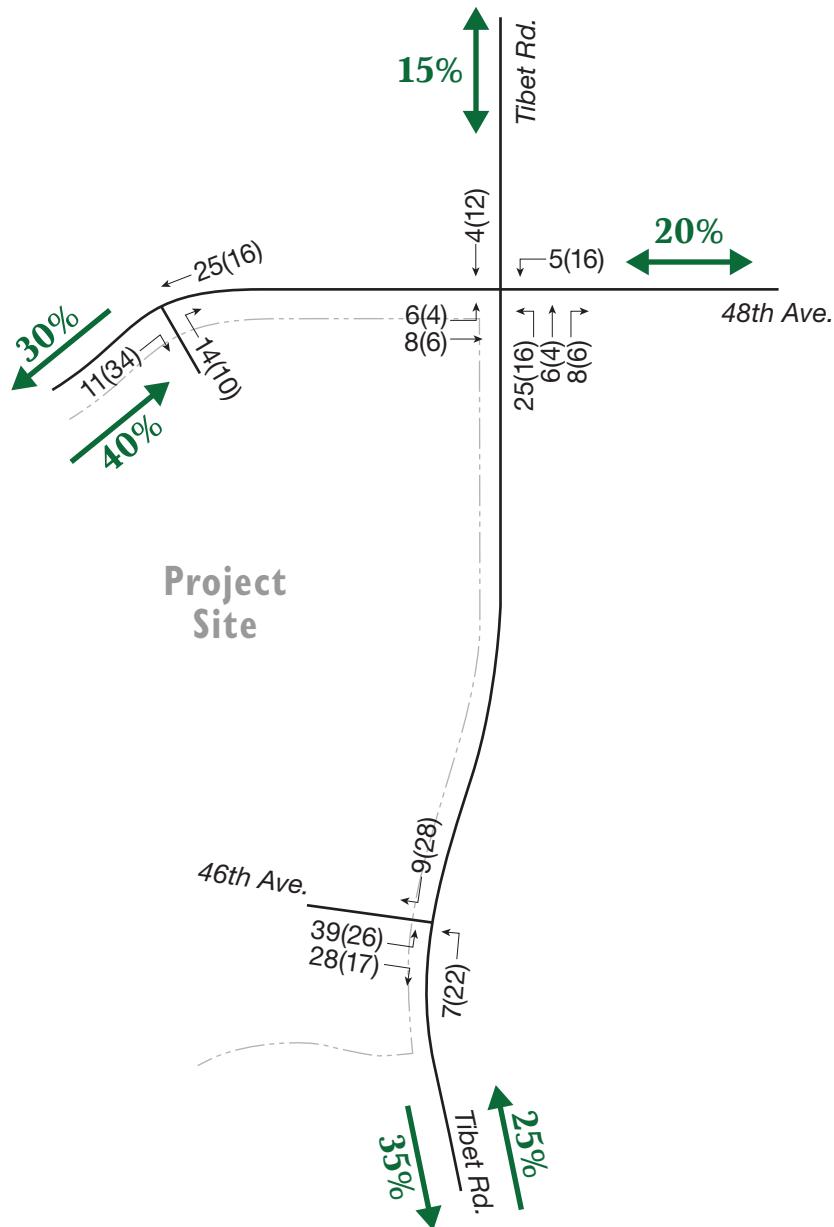

DU=Dwelling Units

II.B Trip Distribution

The estimated distribution of site generated trips within the roadway network was based on existing traffic patterns, location of the site, and projected growth in the project area. The following distribution percentages were used to assign site generated vehicle-trips to the adjacent roadway network for the AM and PM peak hours:

- ▶ **5 percent** to/from the north via Tibet Road
- ▶ **60 percent** to/from the south via Tibet Road
- ▶ **25 percent** to/from the west via 48th Avenue
- ▶ **10 percent** to/from the east via 48th Avenue

The distribution percentages were used to assign site generated vehicle-trips, from **Table 2** to the adjacent roadway network for AM and PM peak hour traffic scenarios. The calculated traffic distribution percentages dictate vehicle movements both to and from the site. **Figure 3** depicts the trip generation for the proposed development.

LEGEND

= Site Trip Distribution

III. BACKGROUND CONDITIONS

This section presents background traffic projections for the 2026 short-term and 2045 long-term planning horizon. The following subsections describe the anticipated roadway network identified by NEATS and the derivation of background traffic projections using the NEATS travel demand model.

In the Short-Term (2026) scenario, it was assumed that the construction of 48th Avenue, Tibet Road, and the E-470 interchange on 48th Avenue would be completed within the vicinity of the site. It was also assumed that the posted speed limit along 48th Avenue would be 45 miles per hour (mph) and 35 mph along Tibet Road. Based on the previously completed studies and analysis of the intersections in the area, it was assumed that the intersection of 48th Avenue with Tibet Road would be signalized upon 2026 short-term conditions. Lane assignments at the intersection were based on the analysis conducted in previous studies.

III.A Background Traffic

The NEATS travel demand model was used as the primary means of developing background traffic for the GVRE Filing 10 traffic study. Specifically, raw model results were extracted from the 2040 travel demand models, and trips estimated to originate from the Filing 10 property, within the NEATS models, were manually removed from the totals, yielding model-based daily background traffic. Other nearby developments' traffic studies were also considered to further refine volumes provided in NEATS based on planned development in the area.

The 2026 short-term background traffic volumes include trips generated by Fulenwider Harvest Mile, Sun Empire, 310 West, and Green Valley Ranch East 5,6, & 17. Additionally, several parcels evaluated in the Windler Master TIS were included in the background volumes, including trips from the following parcels: PA-23, PA-24, PA-25, PA-26, and PA-27. Estimated trips generated by the Green Valley Ranch East 8 & 9 and the remaining parcels evaluated in the Windler Master TIS were added to the 2045 long-term background traffic volumes.

Figure 4 shows background traffic volume estimates for the 2026 Short-Term and 2045 Long-Term scenarios. As shown, background volumes on Tibet Road would be approximately 6,800 to 17,000 vehicles per day (VPD) under the 2026 Short-Term scenario and 9,800 to 22,050 VPD under the 2045 Long-Term within the study area. 48th Avenue would experience approximately 31,500 to 35,700 VPD under the 2026 Short-Term scenario and 36,550 to 45,550 VPD under the 2045 Long-Term within the study area.

III.B Traffic Operations and Conditions

Calculations were carried out to assess operations given current traffic demands. These were conducted using techniques documented in the *Highway Capacity Manual (HCM) 6th Edition* (Transportation Research Board, 2016) using the existing traffic volumes and intersection geometry. Level of Service (LOS) is a qualitative measure of traffic operational conditions based on roadway capacity and vehicle delay. Levels of service are described by a letter designation ranging from A to F, with LOS A representing free-flow travel, while LOS F represents congested conditions. Trafficware's Synchro traffic analysis software (Version 11.1) was used to perform the LOS calculations.

For signalized intersections, LOS is calculated for the entire intersection, while LOS for unsignalized intersections is calculated for movements that must yield right-of-way to other traffic movements. **Table 3** summarizes LOS criteria for signalized and unsignalized (stop-controlled) intersections.

Table 3. Level of Service Criteria

Level of Service	Average Control Delay per Vehicle (sec/veh)	
	Signalized Intersections	Stop/Roundabout Controlled Intersections
A	≤ 10	≤ 10
B	> 10 to 20	> 10 to 15
C	> 20 to 35	> 15 to 25
D	> 35 to 55	> 25 to 35
E	> 55 to 80	> 35 to 50
F	> 80	> 50

Source: HCM 6th Edition, Exhibit 19-8 & Exhibit 20-2

Short-Term Background (2026) Traffic Conditions

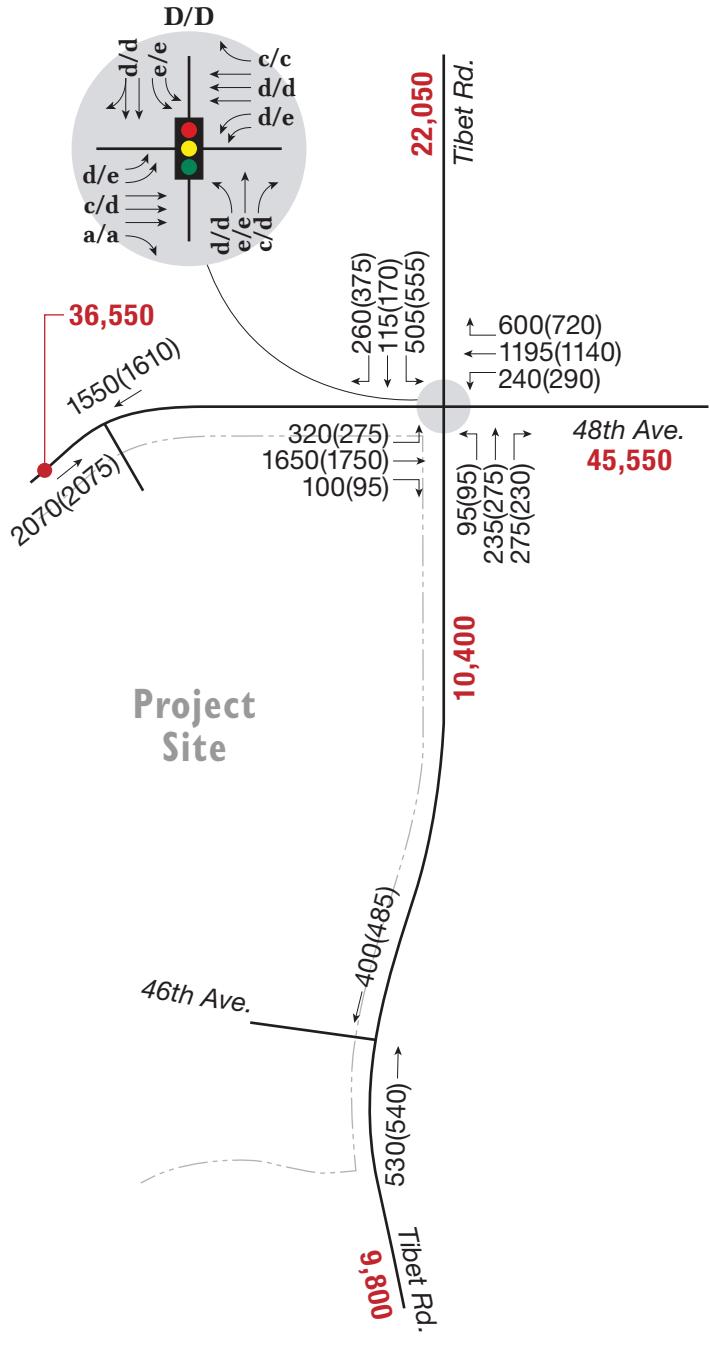

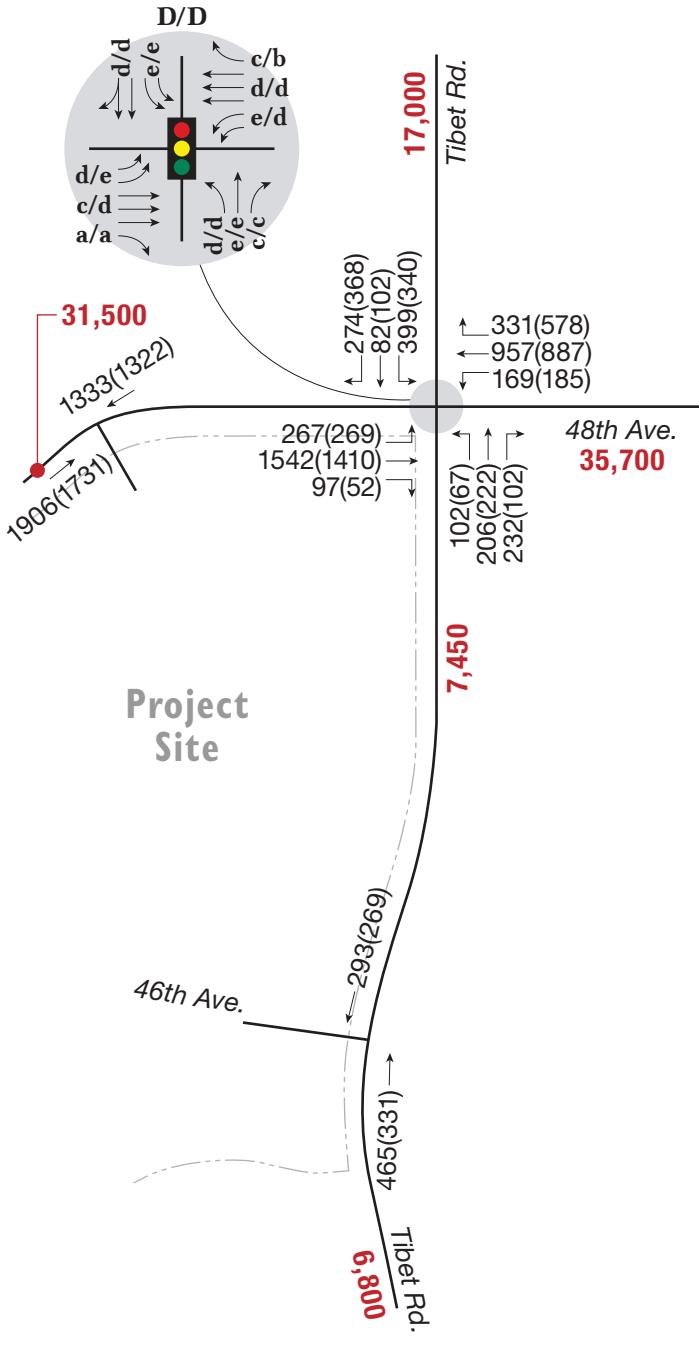

The signalized intersection of 48th Avenue with Tibet Road is anticipated to operate at LOS D during the AM and PM peak hours.

Figure 4 shows the LOS results for Short-Term Background (2026) traffic conditions. Capacity analysis worksheets can be found in **Appendix B**.

Long-Term Background (2045) Traffic Conditions

The signalized intersection of 48th Avenue with Tibet Road is anticipated to operate at LOS D during the AM and the PM peak hours.

Figure 4 shows the LOS results for Long-Term Background (2045) traffic conditions. Capacity analysis worksheets can be found in **Appendix C**.

IV. FUTURE TOTAL CONDITIONS

IV.A Total Traffic Volumes

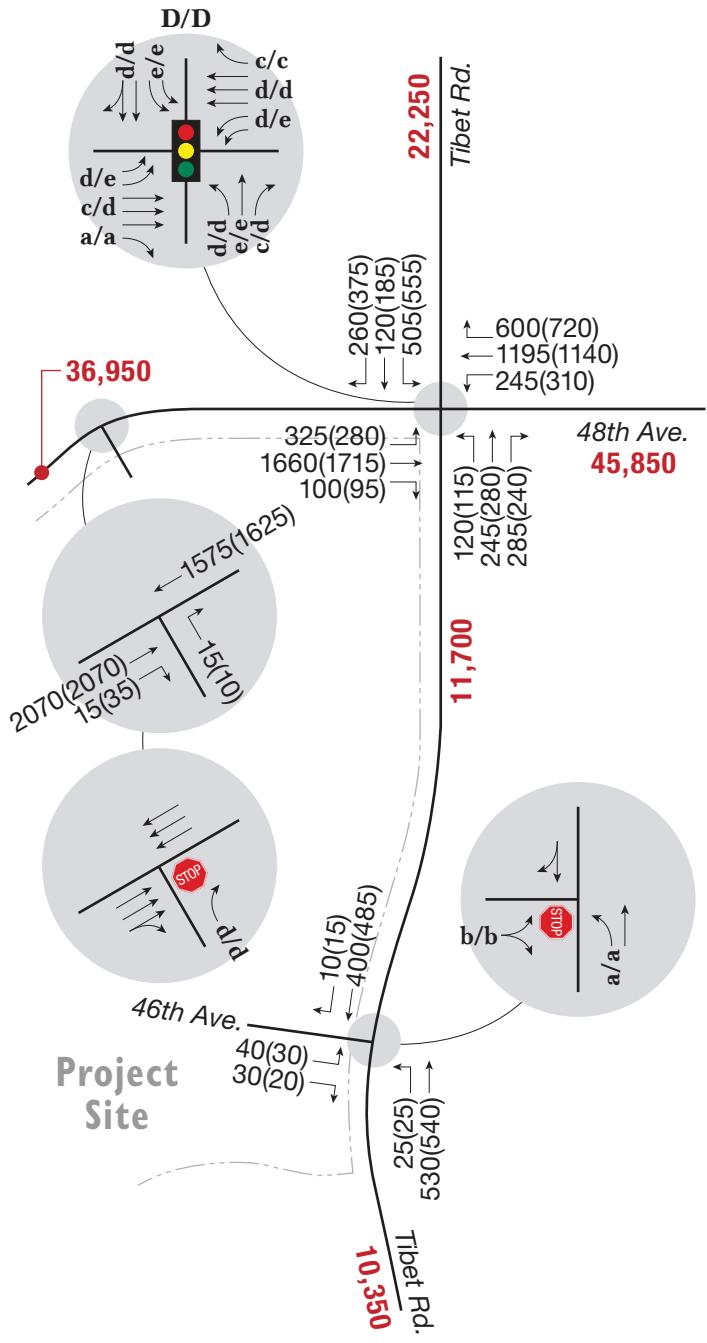

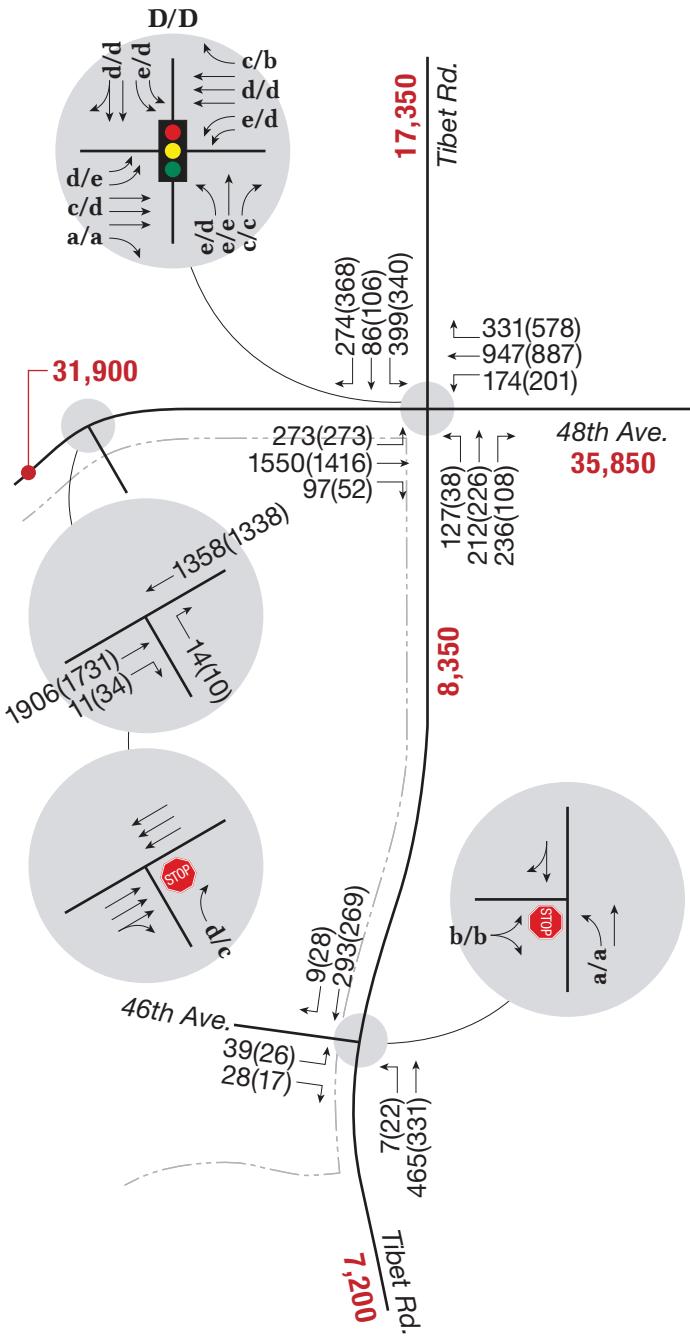

To produce the Short-Term Total (2026) and Long-Term Total (2045) traffic volumes, the site generated traffic volumes shown on **Figure 3** were added to the Short-Term Background (2026) and Long-Term Background (2045) traffic volumes shown on **Figure 4**. Short-Term Total (2026) and Long-Term Total (2045) traffic volumes are shown on **Figure 5**.

As shown, total volumes on Tibet Road would be approximately 7,350 to 17,300 VPD under the 2026 Short-Term scenario and 10,550 to 22,600 VPD under the 2045 Long-Term scenario within the study area. 48th Avenue would experience approximately 31,700 to 35,800 VPD under the 2026 Short-Term scenario and 36,850 to 45,650 VPD under the 2045 Long-Term within the study area.

IV.B Auxiliary Lane Analysis

The Colorado Department of Transportation State Highway Access Code (SHAC) was used to determine storage and taper lengths of auxiliary lanes. It was assumed that 48th Avenue and Tibet Road would be classified as a Non-Rural Arterial (NR-C) within the study area. Table 4-6 and Table 4-8 in the SHAC were used to determine the recommended deceleration length/taper and storage lengths, respectively. The following turn-lane additions and improvements are recommended:

- ▶ Provide a northbound left-turn lane at the intersection of 46th Avenue with Tibet Road. The left-turn lane should provide at least 50 feet of storage length with a 10:1 taper.
- ▶ Per the SHAC, right-turn lanes are generally not required at intersections along six-lane cross sections and are not required if the right turning volume does not exceed 50 in the peak hours for NR-B facilities at speeds of 40 mph or lower. Therefore, an eastbound right turn lane at the RIRO access at the intersection of 48th Avenue with Site Drive #1 is not recommended.
- ▶ Per the SHAC, right-turn lanes are not required if the right turning volume does not exceed 50 in the peak hours for NR-C facilities. Therefore, a southbound right turn lane at the full movement access at the intersection of Tibet Road with 48th Avenue is not recommended.
- ▶ To allow dual westbound left-turn lanes at the intersection of 48th Avenue with Tibet Road, two southbound through lanes will be provided just south of 48th Avenue and taper back roughly 500 feet south of 48th Avenue.

- x/x = AM/PM Peak Hour Critical Movement Level of Service
- = Traffic Signal

IV.C Signal Warrant Analysis

A review was performed to determine if *Manual on Uniform Traffic Control Devices (MUTCD) for Streets and Highways, 2009 Edition*, traffic signal Warrant 1 (Eight-Hour Vehicular Volume) and/or Warrant 2 (Four-Hour Vehicular Volume) are satisfied for stop-controlled study intersection(s) under Short-Term Total (2026) and Long-Term Total (2045). Posted speed and existing and/or proposed lane configurations were assumed at study intersections for the analysis scenario. Right-turn reductions were applied at the intersections based on reduction criteria developed by Felsburg Holt & Ullevig. The following criteria were used and applied at the intersections:

- ▶ 4-Legged Intersections:
 - Shared left/through/right-turn lane: 25 percent
 - Shared left/through/right-turn lane (with acceleration lane): 25 percent
 - Exclusive left-turn & shared through/right-turn lane: 25 percent
 - Exclusive left-turn & shared through/right-turn lane (with acceleration lane): 50 percent
 - Exclusive right-turn lane: 50 percent
 - Exclusive right-turn lane (with acceleration lane): 75 percent
- ▶ 3-Legged Intersections:
 - Shared left/right-turn lane: 25 percent
 - Shared left/right-turn lane (with acceleration lane): 25 percent
 - Exclusive right-turn lane: 50 percent
 - Exclusive right-turn lane (with acceleration lane): 75 percent

Table 4 summarizes the results of the analysis, and **Appendix A** presents graphical results of the MUTCD warrant analysis.

Table 4. MUTCD Signal Warrants, Total Traffic

Intersection	Existing Traffic Control	Short-Term Total (2026) Signal Warrant	Long-Term Total (2045) Signal Warrant
46 th Avenue & Tibet Road	–	Not Warranted	Not Warranted
48 th Avenue & Site Drive #1	–	Not Warranted	Not Warranted

Based on the results of the signal warrant analysis, traffic signals are **not warranted** at either of the two intersections that provide access into the development. As noted earlier, 48th Avenue with Tibet Road is already planned to be signalized based on the previously completed studies in the area and, therefore, signal warrants were not evaluated as part of this study.

Traffic control at the internal intersections within Filing 10 would be unsignalized, with STOP sign-control on the minor approaches. **Figure 6** depicts the proposed internal traffic control. Given the limited continuity of the internal local streets, additional traffic calming measures are not envisioned within Filing 10.

LEGEND

= Stop Sign

IV.D Traffic Operations and Conditions

Short-Term Total (2026) Traffic Conditions

The future signalized intersection of 48th Avenue with Tibet Road is anticipated to operate at LOS D during the AM and PM peak hours. At the stop-controlled intersections, all movements are anticipated to operate at LOS D or better during the peak hours.

Figure 5 shows the LOS results for Short-Term Total (2026) traffic conditions. Capacity analysis worksheets can be found in **Appendix D**.

Long-Term Total (2045) Traffic Conditions

The future signalized intersection of 48th Avenue with Tibet Road is anticipated to operate at LOS D during the AM and PM peak hours. At the stop-controlled intersections, all movements are anticipated to operate at LOS D or better during the peak hours.

Figure 5 shows the LOS results for Long-Term Total (2045) traffic conditions. Capacity analysis worksheets can be found in **Appendix E**.

Estimated 95th Percentile Queue Length Analysis

The 95th percentile queue lengths were reviewed at the study intersection for Short-Term (2026) and Long-Term (2045) traffic conditions. **Table 5** summarizes the findings for the signalized intersections within the study area. The 95th percentile queue lengths for the AM and PM peak hours and recommended storage lengths are provided in the table.

Recommendations for vehicle storage lengths at each of the external study area intersections are included in **Table 5** for use in identifying construction needs. These dimensions represent the storage space necessary to meet the 95th percentile maximum queue during either the AM or PM peak hour.

Output from the traffic analysis effort was used to recommend these storage lengths, using the following methodology:

- ▶ **Left turn lane storage lengths.** At signalized intersections, the greater of the HCM 6th Edition or Synchro methodology queue calculations were reported. For unsignalized intersections, the HCM 6th Edition calculation was reported.
- ▶ **Through movements.** For signalized intersections, Synchro calculation results were reported. No through movement queues are reported for unsignalized intersections as the through movements are free.
- ▶ **Right turn movements.** The Synchro queue length was used. HCM 6th Edition information was not used because HCM's signalized intersection methodology does not account for right turns on red.

Deceleration lane and taper lengths should be added to these dimensions per City of Aurora standards to identify the total length of each auxiliary lane.

Table 5. 95th Percentile Queue Lengths, Short- and Long-Term Traffic

Location	Critical Movements	SHAC Required Storage Length	Recommended Storage Length	95 th %ile Queue Length (ft) (AM/PM Peak)

V. SUMMARY AND RECOMMENDATIONS

Green Valley Ranch East Filing 10 consists of 180 single family units, which includes 82 single-family detached and 98 single-family attached (duplex), to be developed within the Green Valley Ranch East master plan. The site is located in the southwest quadrant of the future 48th Avenue and Tibet Road intersection in Aurora, Colorado.

It is anticipated that vehicular access will be provided via two access points: one full access onto Tibet Road via 46th Avenue and one right-in right-out (RIRO) access onto 48th Avenue. It is anticipated that the full buildout of the site would be completed in 2026.

The full buildout of the development is anticipated to generate approximately 1,537 daily vehicle-trips to the roadway network, including 107 vehicle-trips during the AM and 137 vehicle-trips during the PM peak.

The potential traffic impacts of the development were evaluated under Short-Term Background (2026), Long-Term Background (2045), Short-Term Total (2026), and Long-Term Total (2045) conditions. Based on the results of the analysis, the key findings and recommendations of this study are as follows:

- ▶ Provide a two-way stop-controlled (TWSC) condition at the two proposed site access approaches at 46th Street and Site Drive #1 (RIRO). These intersections are anticipated to continue to operate acceptably through the Long-Term Future as unsignalized intersections.
- ▶ Provide a northbound left-turn lane at the intersection of 46th Avenue with Tibet Road. The left-turn lane should provide at least 50 feet of storage length with a 10:1 taper based on SHAC guidance.

- ▶ To allow dual westbound left-turn lanes at the intersection of 48th Avenue with Tibet Road, two southbound through lanes will be provided south of 48th Avenue and taper back down to one lane approximately 500 feet south of 48th Avenue.
- ▶ Traffic control at the internal intersections within Filing 10 would be unsignalized, with STOP sign-control on the minor approaches. **Figure 6** depicts the proposed internal traffic control.
