## I. INTRODUCTION

M.A. Mortenson Company is proposing to develop an approximately 74-acre site within the High Point development in Aurora, Colorado, encompassing Planning Area (PA) 80 of the master development plan. The site is located along the east side of future Gun Club Road, bounded to the south by the future 65<sup>th</sup> Avenue and to the north by the future 68<sup>th</sup> Avenue. **Figure 1** illustrates the location of the site and the adjacent primary roadway network (existing and future planned roadways).

The proposed site would be developed as a 920 thousand square foot (KSF) distribution center. Primary access to the site will be provided onto 65<sup>th</sup> Avenue via one full movement site driveway, and onto Gun Club Road via one two full movement site driveways. **Figure 2** depicts the current site plan concept.

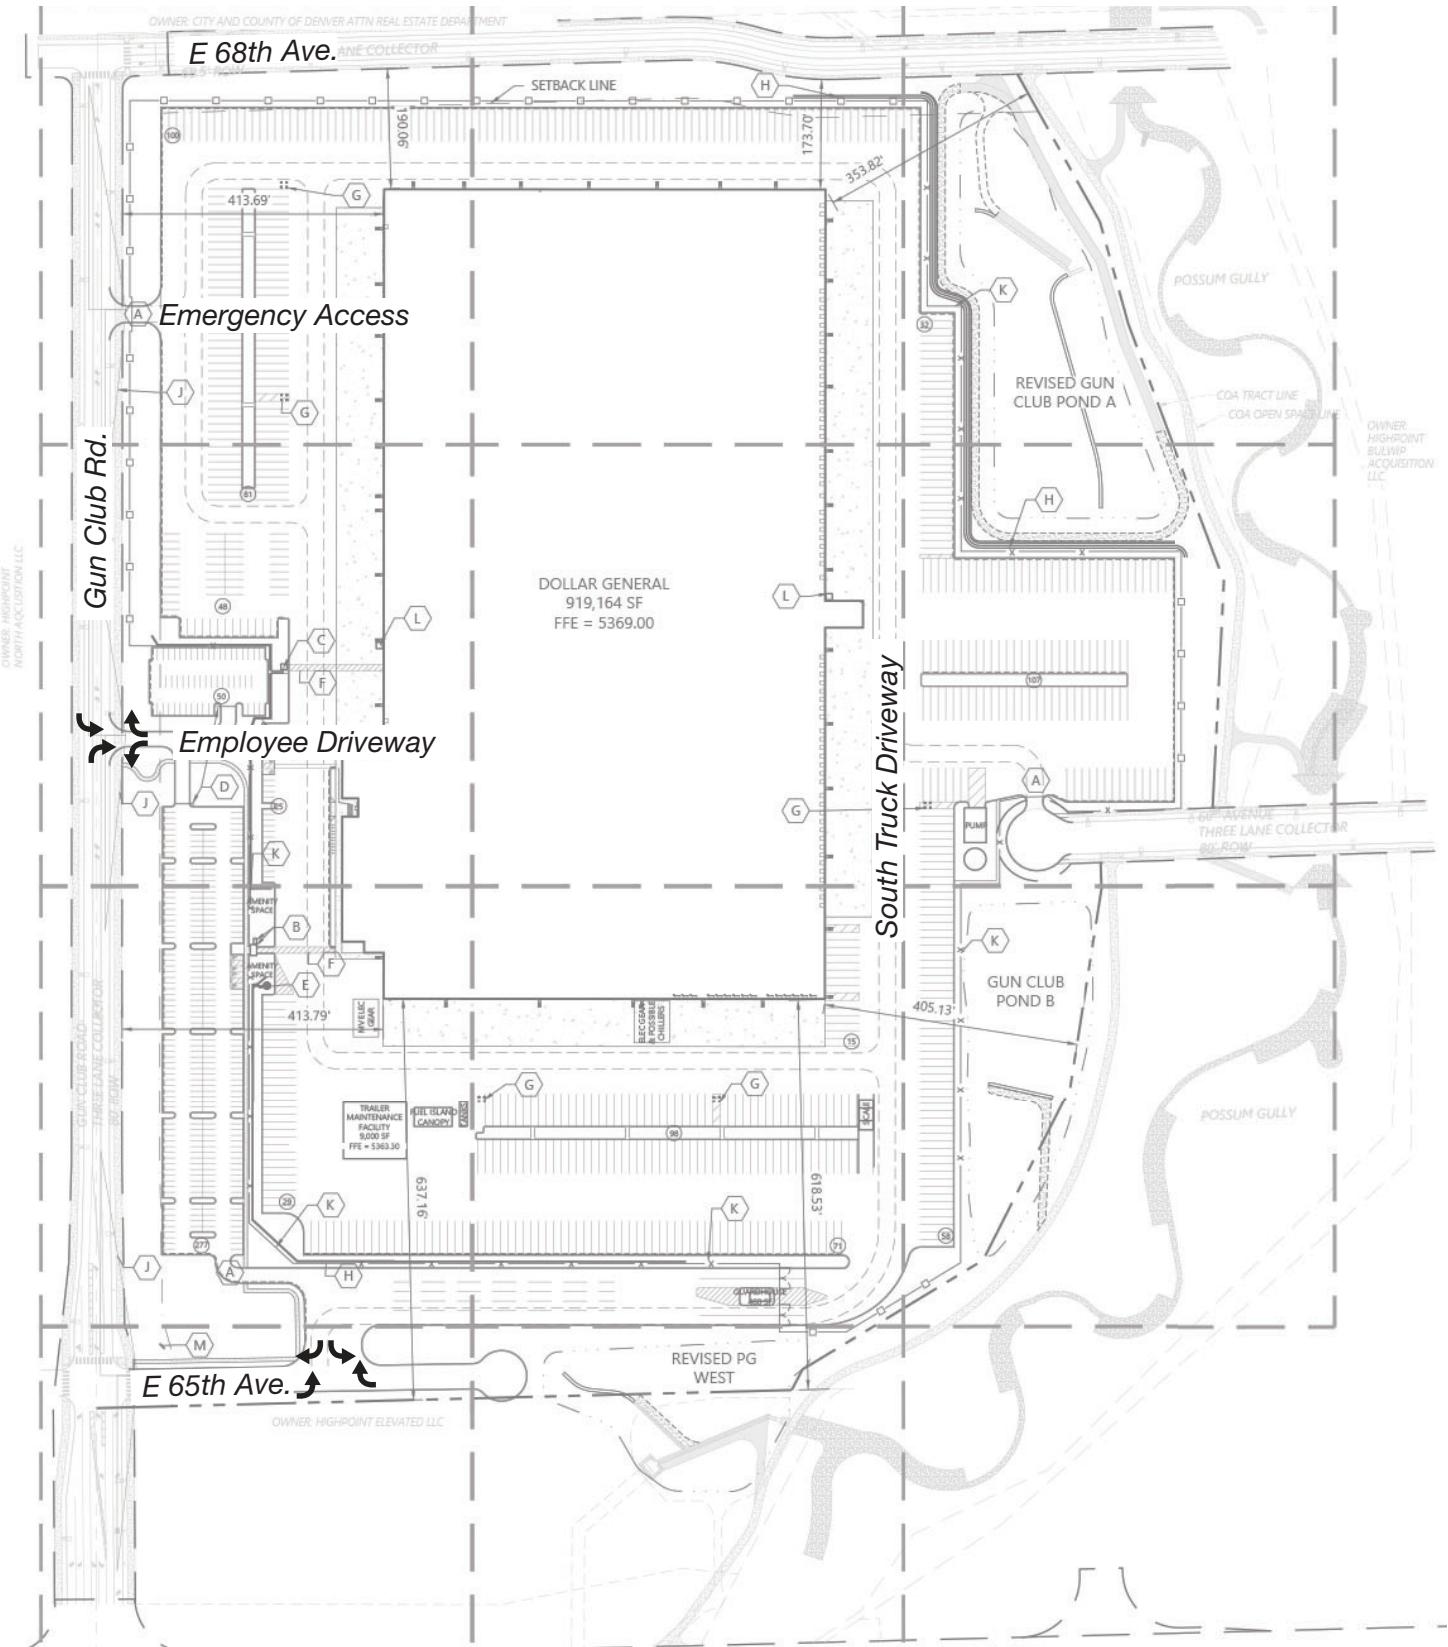

The purpose of this Transportation Impact Study (TIS) is to estimate the potential traffic impacts specific to the proposed development and to identify potential roadway and/or intersection improvements and traffic control needs. Short- and long-term future scenarios were explored for this site. These scenarios examine the traffic impacts within the context of the year 2023 and 2040 horizon. An existing scenario has been omitted as all roadways within the study area are either under construction at the time of project initiation, November 2021, or are not planned to be constructed until 2022.

This study builds from the *High Point Master Plan Traffic Impact Analysis*, January 2020, prepared by Felsburg Holt & Ullevig (FHU), that addressed transportation needs of the 1,180-acre High Point Framework Development Plan (FDP).

= Aurora Highlands

## II. EXISTING CONDITIONS

Existing conditions surrounding the proposed Dollar General Distribution Center site have not changed significantly since the *High Point Master Plan Traffic Impact Study Analysis* was completed.

### II.A. Surrounding Land Use

The area around the Dollar General Distribution Center site is mostly vacant. The Gaylord Rockies Resort is located approximately 2 miles to the west of the site. The Green Valley Ranch residential development also exists about 1 mile to the southwest in Denver. Denver International Airport (DEN) is located to the north, and early construction of the first phases of the Hyde development are beginning within High Point to the south.

### II.B. Roadway System

Very few roadways exist near the site. 64<sup>th</sup> Avenue is the one notable roadway that will run east-west to the south of the site. It was under construction between E-470 and Jackson Gap Street as of fall 2021 as a four-lane arterial. West of the E-470 Interchange, 64<sup>th</sup> Avenue was recently improved in association with the Gaylord Rockies Resort. It extends further west to Tower Road but provides only two lanes for much of this length. Gun Club Road is currently under design and is anticipated to begin construction in spring 2022. E-470 exists west of the site, but site access to the E-470/64<sup>th</sup> Avenue Interchange does not yet exist to the east.

### II.C. Existing Traffic Volumes and Operations

No existing traffic data are available as none of the roadway network in the immediate vicinity of the site exists under current conditions. Hence, no existing conditions operational analyses were completed.

## III. PROPOSED CONDITIONS

The area surrounding the Dollar General Distribution Center site is expected to develop over the next 20 to 30 years based on market conditions and regional planning completed by the City of Aurora.

### III.A. Future Road Network

In 2018, the City of Aurora completed the NEATS Refresh study, which provides Year 2040 and regional buildout transportation recommendations for the roadways and the multimodal transportation system. The NEATS Refresh study area encompassed a regional area extending from approximately Tower Road east to Schumaker Road, and from Jewell Avenue on the south to 72<sup>nd</sup> Avenue on the north. Recommendations in the area of the Dollar General Distribution Center site include constructing 64<sup>th</sup> Avenue to meet major arterial standards, including four through lanes (two per direction), plus turn lanes.

Gun Club Road and 68<sup>th</sup> Avenue will provide additional access to the site and will ultimately be constructed as three-lane collectors within the High Point development. Construction of both Gun Club Road between 64<sup>th</sup> Avenue and 68<sup>th</sup> Avenue and 68<sup>th</sup> Avenue between Gun Club Road and Denali Street is anticipated in 2022. Construction of 68<sup>th</sup> Avenue east of Denali Street will likely lag several years due to the need to move a lift station that is located immediately east of Denali Street.

### III.B. Site Trip Generation

The current proposed distribution center will consist of 920 KSF of industrial space. The *High Point FDP Master Plan Traffic Study* prepared by FHU and approved in January 2020 had assumed 1,500 KSF of industrial space in PA-80. Trip generation estimates were developed using data provided by Dollar General about employment and operations estimates for the proposed distribution center. Operations of the site plan included two shifts of approximately 300 employees per shift and the loading/unloading of 150 semi-trailers per day. Based on this information, it is assumed that trucks represent approximately 20 percent of the site traffic. **Table I** shows the trip generation for the proposed development, which is estimated to generate 3,000 trips per day when built out.

**Table I. Trip Generation Summary**

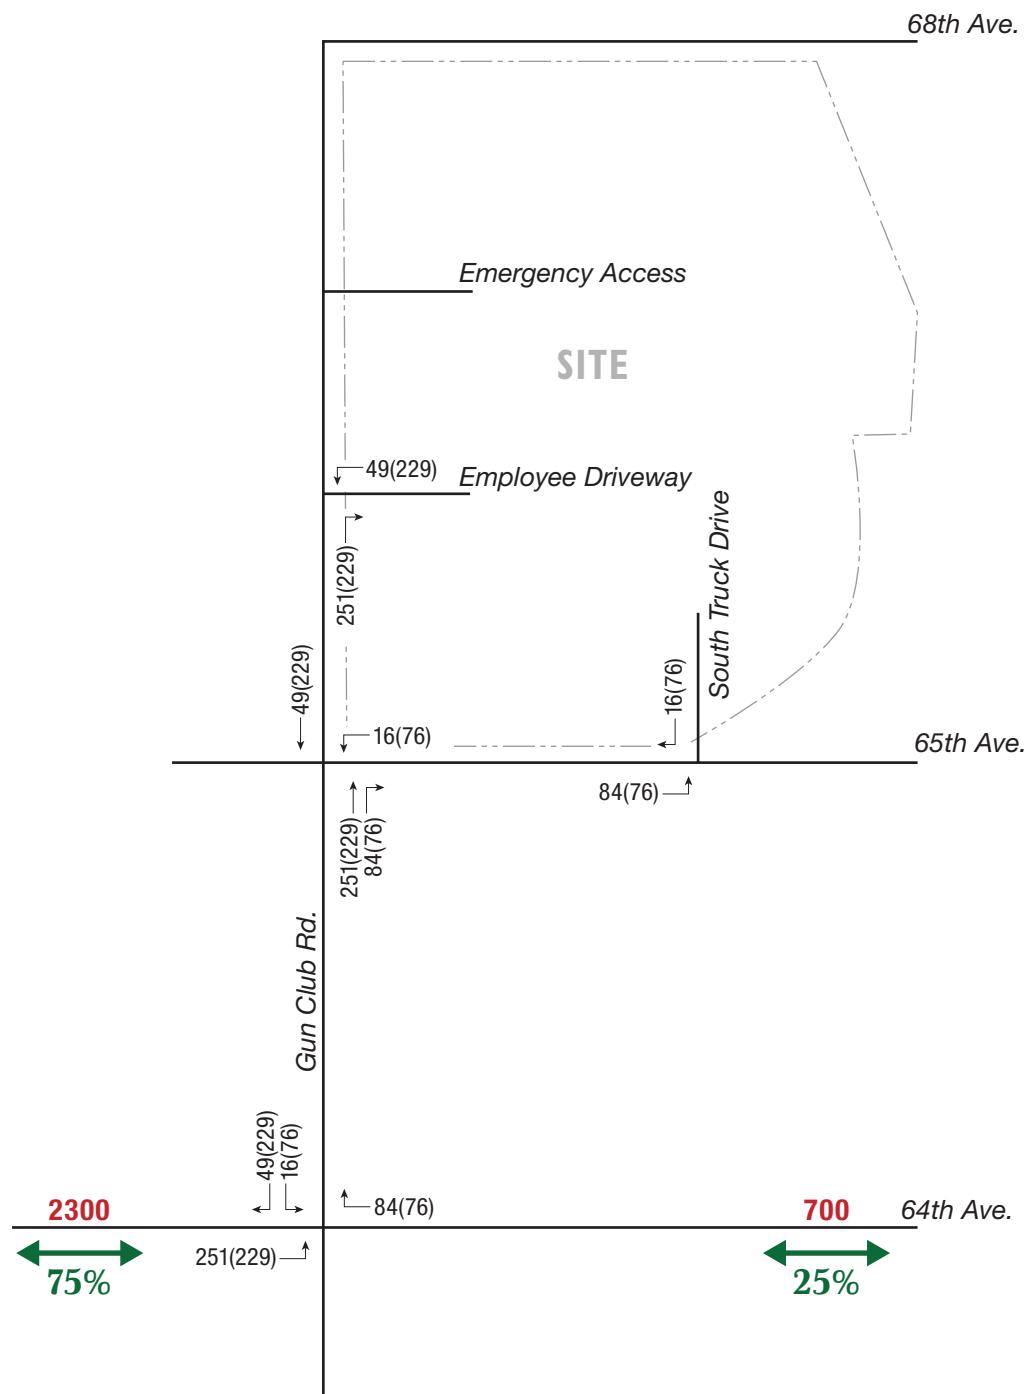

Land Use	Intensity	ITE Code	Daily Trips	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Distribution Center	920 KSF	Custom	3,000	335	65	400	305	305	610
			<b>TOTAL</b>	<b>3,000</b>	<b>335</b>	<b>65</b>	<b>400</b>	<b>305</b>	<b>305</b>

The *High Point FDP Master Plan Traffic Study* had estimated trip generation as approximately 5,000 daily trips and 600 AM and PM peak hour trips for PA-80. The proposed Dollar General is 920 KSF as compared to the previously estimated 1,500 KSF of industrial space in the FPD. This reduction in size is estimated to reduce daily and AM peak hour volumes by approximately 60 percent. However, due to the shift change between first and second shift, the PM peak hour trip generation total values are similar to those of the FDP study but with a balanced inbound and outbound flow as compared to predominantly outbound in the FDP study.

### ***III.C. Trip Distribution and Traffic Assignment***

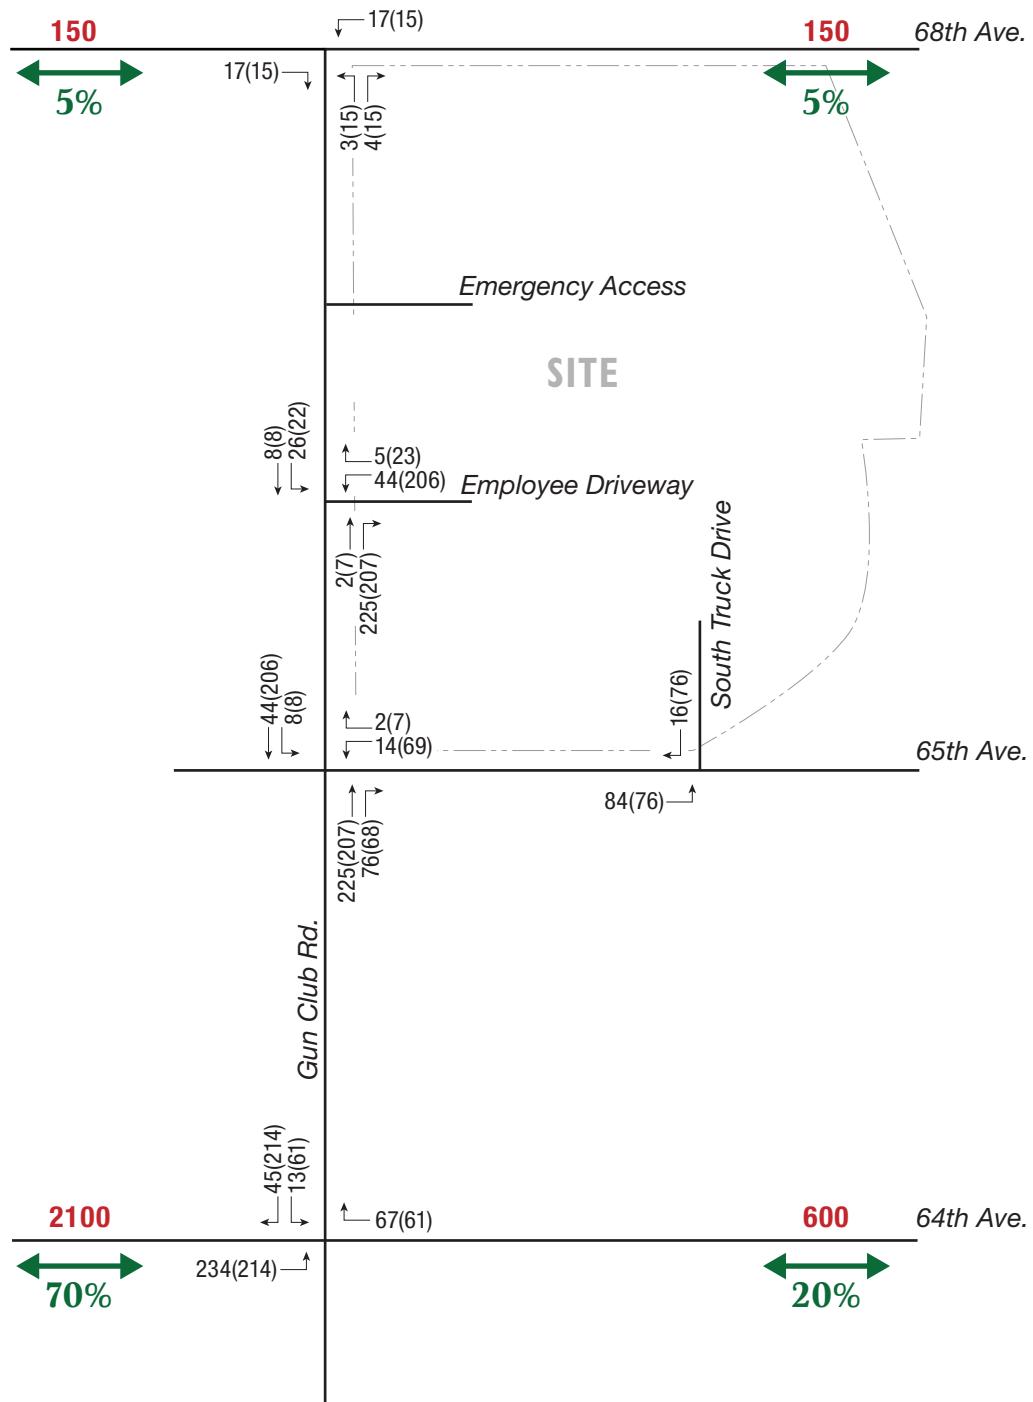

Trip distribution estimates for this site were based on those used in the High Point FDP Master Plan. Independent distributions were created for each Traffic Analysis Zone (TAZ) within the master study. The Dollar General Distribution Center lies in TAZ 10 from the master study, and those corresponding distributions were used for this study. The greatest component of site traffic will be toward the west via 64<sup>th</sup> Avenue to access E-470 and other arterials such as Tibet Street and Picadilly Road for more regional connectivity as the roadway network in the area is built out. Gun Club Road is estimated to serve the greatest amount of site traffic reaching the entire site generated traffic of 3,000 vehicles per day (VPD) south of the site in the short term and 2,700 VPD in the long term. Gun Club Road south of the site is projected to serve less traffic in the long term as 68<sup>th</sup> Avenue is anticipated to be built out providing additional connectivity east and west of the site.

**Figure 3** and **Figure 4** show the site-trip distribution percentages and the trip assignment resulting from applying the percentages for site traffic for short- and long-term scenarios. These vary between the two scenarios due to a more limited roadway network in the short term. As indicated, Gun Club Road will see the largest percentage of site traffic.

## IV. FUTURE BACKGROUND CONDITIONS

Background traffic conditions have been developed to serve as a basis for determining the potential impacts from the Dollar General Distribution Center on the study area roadway network.

### IV.A. Short-Term Future Background

The short-term scenario reflects forecasted traffic conditions for opening day of the Dollar General Distribution Center. This is assumed to occur in 2023.

#### Roadway System

Very few roadways exist within High Point at this time, and few additional roadways are planned in the short term. 64<sup>th</sup> Avenue between E-470 and Jackson Gap Street, which is related to development within High Point, Fulenwider, and Porteos, is currently under construction and is anticipated to be completed in late 2021 or early 2022. Gun Club Road between 64<sup>th</sup> and 68<sup>th</sup> Avenues, as well as 68<sup>th</sup> Avenue between Gun Club Road and Denali Street, are anticipated to be constructed beginning in mid-2022 and to be completed prior to construction of the Dollar General Distribution Center in 2023.

#### Traffic Volumes

Background traffic is the component of roadway volumes that would use the adjacent roadway system regardless of site development. Along the roadways adjacent to the site, little to no background traffic is expected beyond through traffic along 64<sup>th</sup> Avenue and traffic south of 64<sup>th</sup> on Gun Club Road associated with the Hyde development in the short term.

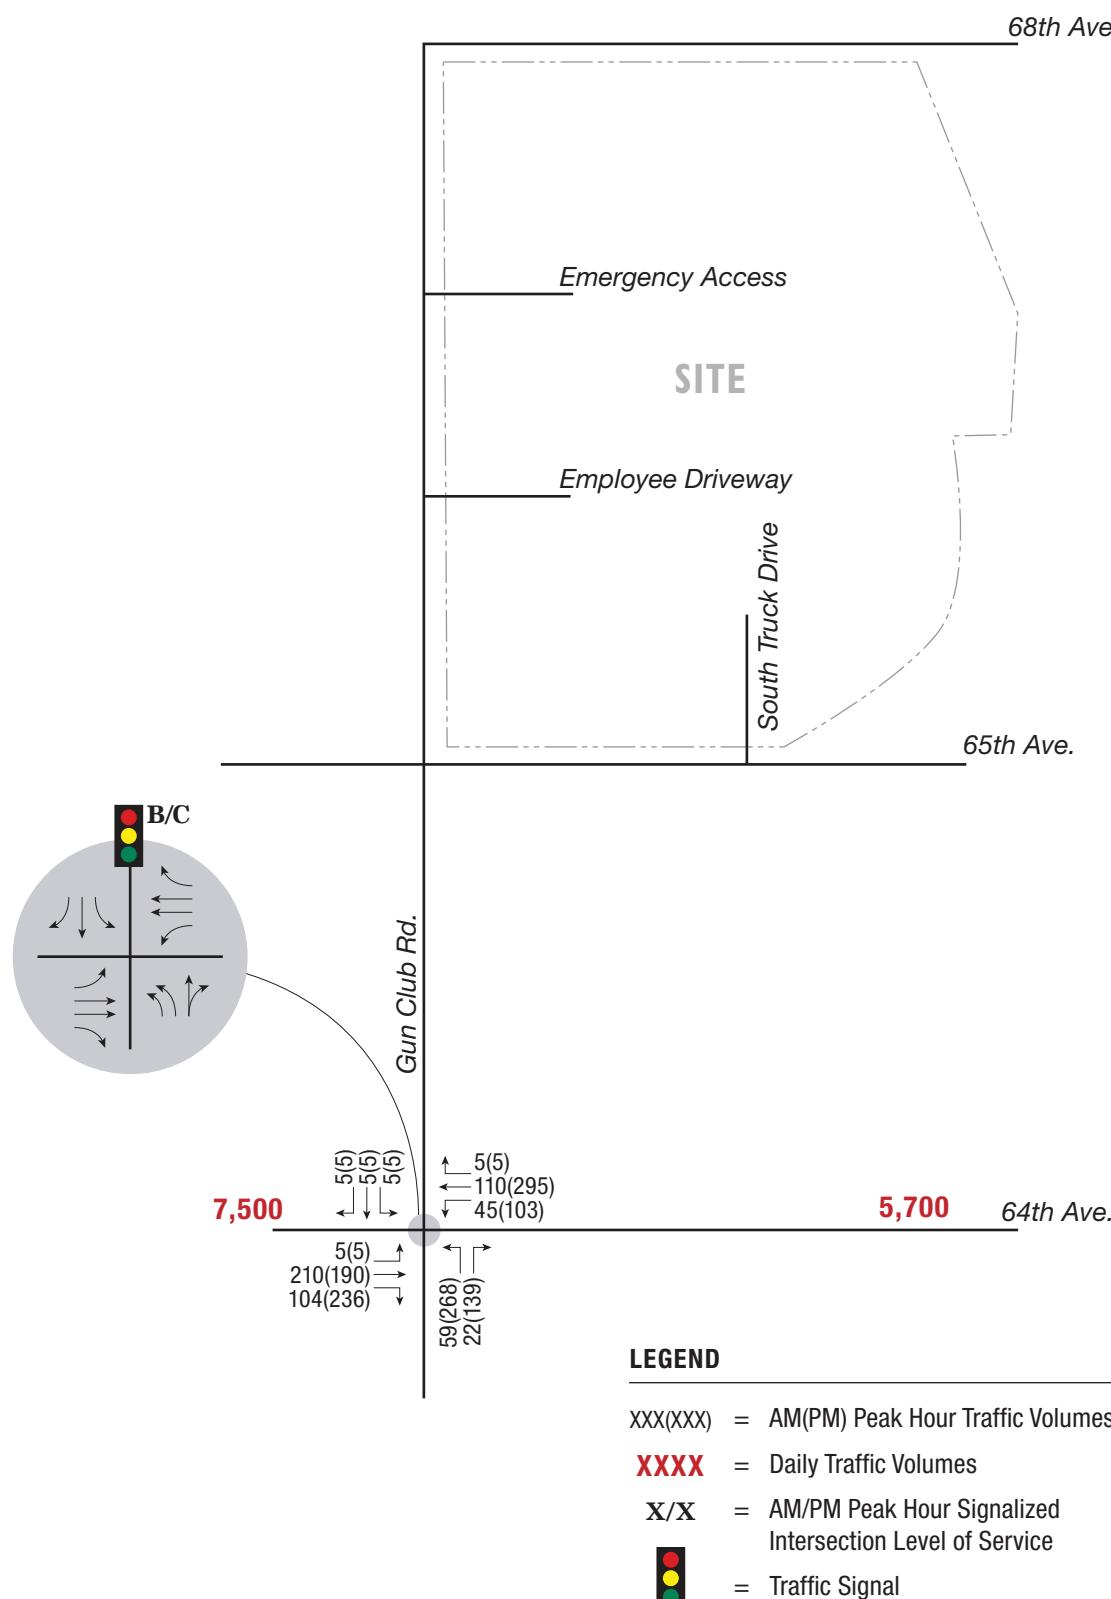

City of Aurora staff have requested opening day analysis. For these purposes, one-fifth of 2040 volumes presented in the 64<sup>th</sup> Avenue ISP, which built on analysis from the *High Point Master Plan TIS* and other area traffic studies, have been assumed for 64<sup>th</sup> Avenue through traffic in 2023, under the assumption that uniform growth will occur in the area over the next 20 years. This is likely a conservative estimate of traffic volumes for the short-term scenario.

Calculations were carried out to assess traffic operations given short-term background traffic demands. These analyses were conducted using techniques documented in the *Highway Capacity Manual, 6<sup>th</sup> Edition* (Transportation Research Board, 2016) using the forecasted traffic volumes and intersection geometry. Level of Service (LOS) is a qualitative measure of traffic operational conditions based on roadway capacity and vehicle delay. Levels of service are described by a letter designation ranging from A to F, with LOS A representing almost free-flow travel, while LOS F represents congested conditions. For signalized intersections, LOS is calculated for the entire intersection, while LOS for unsignalized intersections is calculated for movements that must yield right-of-way to other traffic movements.

**Figure 5** shows the operational results based on the projected short-term background traffic demands along the study area roadways and intersections. 64<sup>th</sup> Avenue is estimated to serve the greatest amount of background traffic reaching up to 7,500 VPD west of the site. These volume projections are likely extremely conservative as they are nearly 41 percent higher than the projections provided in the 2030 NEATS modeling.

#### Traffic Control and Operations

Due to the low expected volumes, all intersections are anticipated to operate acceptably as side-street stop-controlled intersections in the short-term scenario, with the exception of Gun Club Road/64<sup>th</sup> Avenue, which is anticipated to meet signal warrants. As illustrated on **Figure 5**, all intersections are projected to operate within acceptable parameters, at LOS C or better, during peak times given the forecasted short-term background traffic. **Appendix A** includes signal warrants and **Appendix B** includes LOS worksheets.

## **IV.B. Long-Term Future Background**

The long-term scenario reflects forecasted traffic conditions in 2040, which was the long-term forecast year for the High Point FDP and the NEATS Study mentioned previously.

### **Roadway System**

By year 2040, High Point is assumed to be built out for the purposes of this analysis. This includes the full roadway network surrounding the site assuming full construction of 64<sup>th</sup> Avenue, Gun Club Road, and 68<sup>th</sup> Avenue.

### **Traffic Volumes**

The long-term background traffic has been estimated using traffic volume projections from the *High Point FDP Master Plan Traffic Study*. Trips are based on a variety of studies, including the *High Point FDP Master Plan Traffic Study*, the 68<sup>th</sup> Avenue ISP prepared by FHU and approved in April 2021, and the *Hyde Industrial TIS* prepared by FHU and approved in August 2021, which further refined analysis from the original study based on more developed site plans than what was available at the time the FDP was prepared. Known development replaced previous assumptions from the *High Point FDP Master Plan Traffic Study* and background traffic for this study are those refinements less the assumptions for the Dollar General Distribution Center parcel. Relevant studies used to develop background traffic volumes are located in **Appendix C**.

**Figure 6** shows the projected long-term background traffic demands along the study area roadways and intersections. 64<sup>th</sup> Avenue is estimated to serve the greatest amount of background traffic reaching up to 27,700 VPD west of the site.

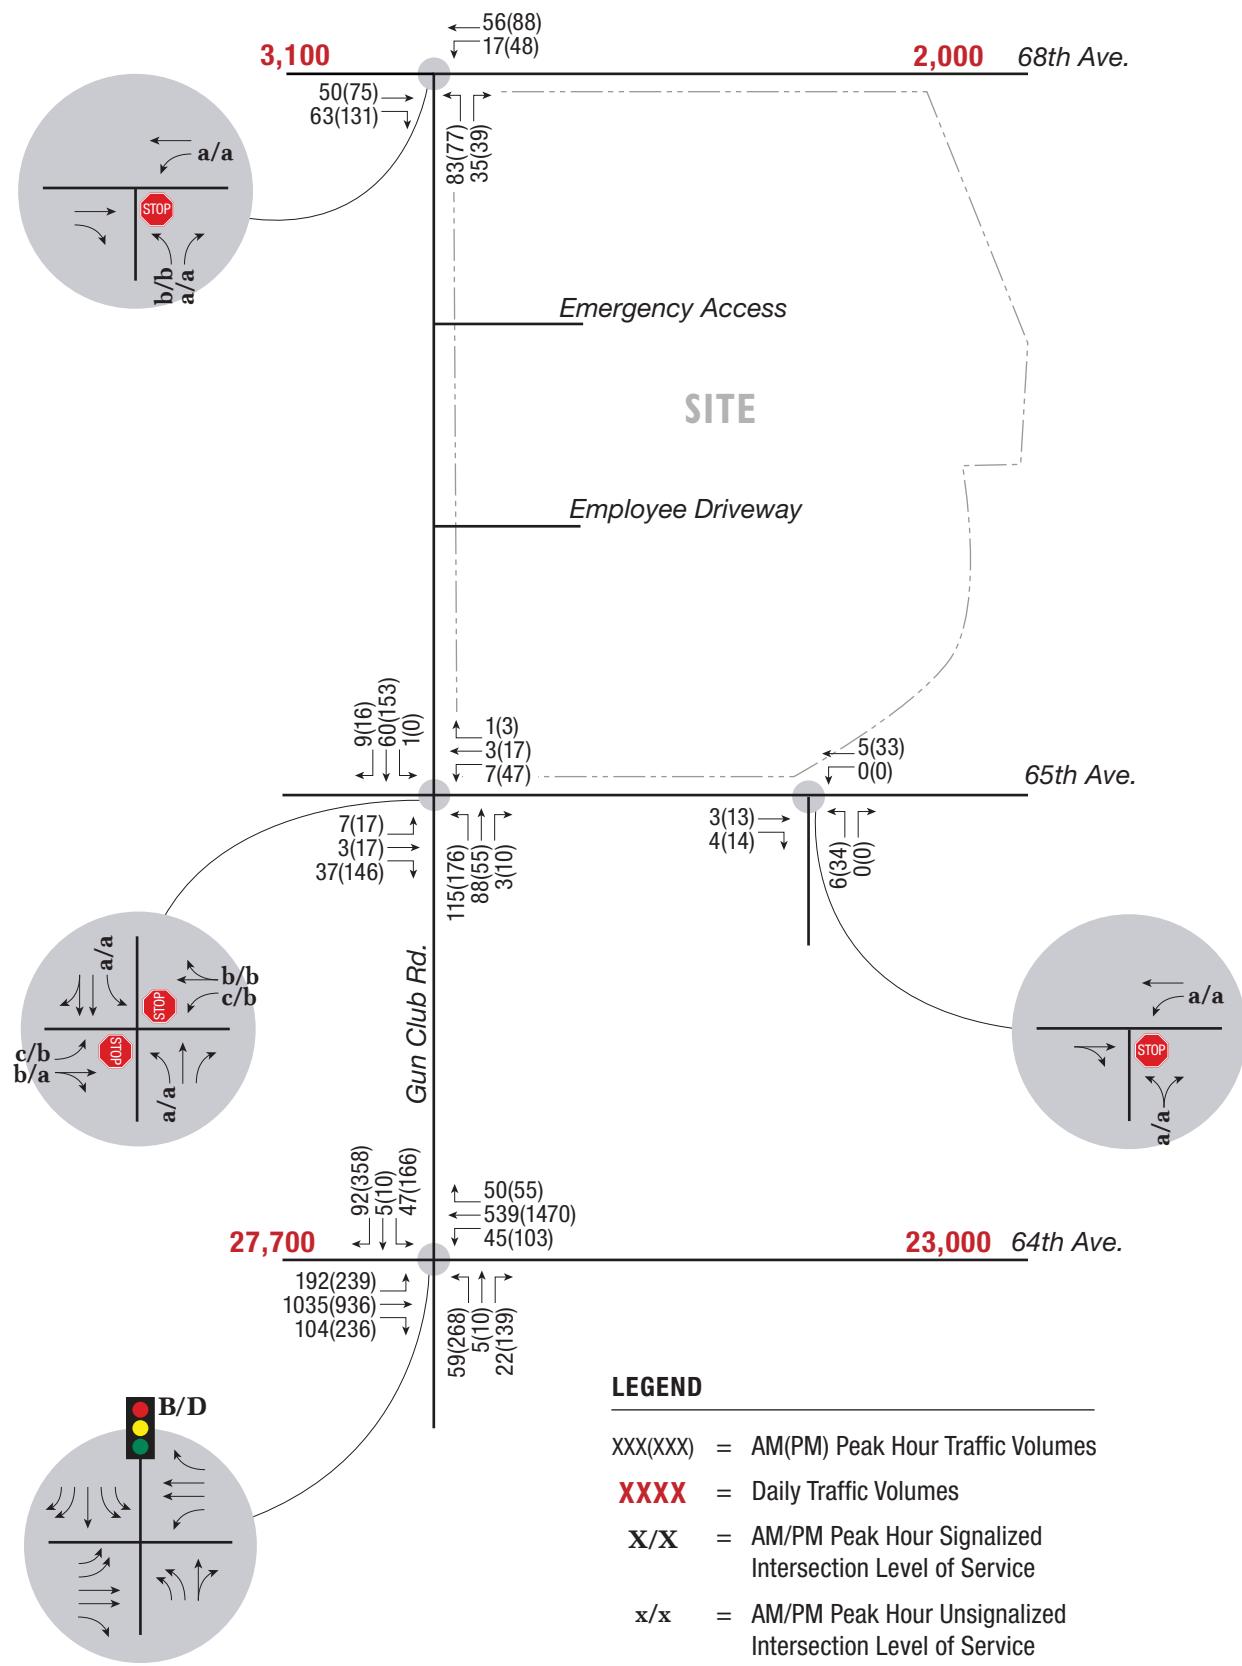

### **Traffic Control**

All study area intersections have been assumed to be under side-street stop-control, with the exception of the 64<sup>th</sup> Avenue/Gun Club Road. 64<sup>th</sup> Avenue/Gun Club Road was identified for signalization in the *High Point FDP Master Plan Traffic Study* and further confirmed in the *Hyde Industrial TIS*.

### **Traffic Operations**

The long-term future background traffic volumes were used as the basis for intersection capacity analyses, the results of which are also shown on **Figure 6** (**Appendix B** includes LOS worksheets).

As indicated, all intersections and movements are projected to operate within acceptable parameters, at LOS D or better, during peak times given the long-term background traffic.

## V. TOTAL TRAFFIC CONDITIONS

The background volumes and site traffic presented previously were combined to reflect total traffic conditions surrounding the site, and total traffic operations were evaluated.

### V.A. Short-Term Future

The Dollar General Distribution Center and Hyde Industrial would be the first sites to be developed within High Point east of E-470.

The short-term site generated traffic volumes illustrated on **Figure 3** were added to the short-term future background traffic volumes found on **Figure 5** to produce the year 2023 total traffic volumes shown on **Figure 7**. 64<sup>th</sup> Avenue is estimated to serve the greatest amount of total traffic reaching up to 9,800 VPD west of the site.

Intersection capacity analyses were conducted using the short-term total peak hour volumes and intersection geometrics as shown on **Figure 7**. **Appendix D** includes analysis worksheets. As indicated, traffic operations would remain acceptable at LOS D or better. It should be noted that this LOS D is the short-term.

### V.B. Long-Term Future

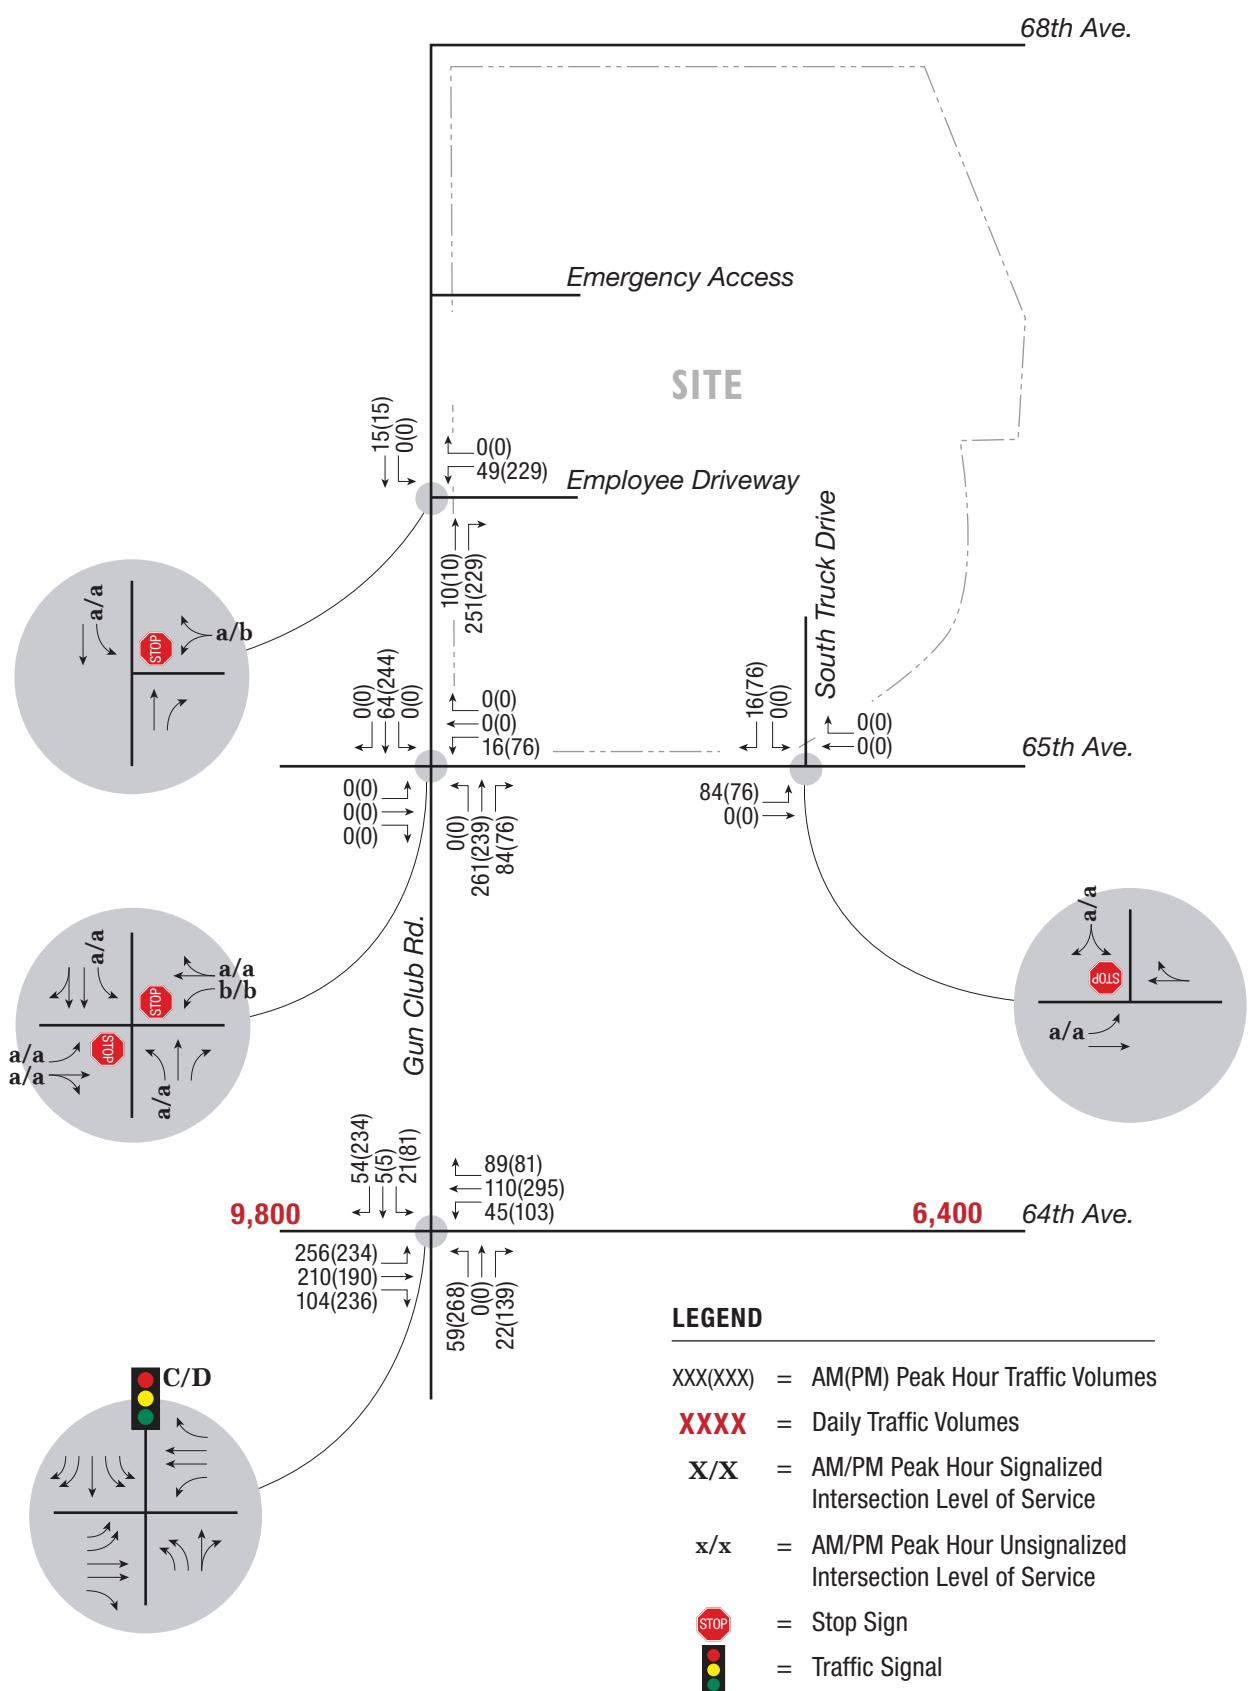

The site generated traffic volumes illustrated on **Figure 4** were added to the long-term future background traffic volumes found on **Figure 6** to produce the year 2040 total traffic volumes shown on **Figure 8**. 64<sup>th</sup> Avenue is estimated to serve the greatest amount of total traffic reaching up to 29,800 VPD west of the site.

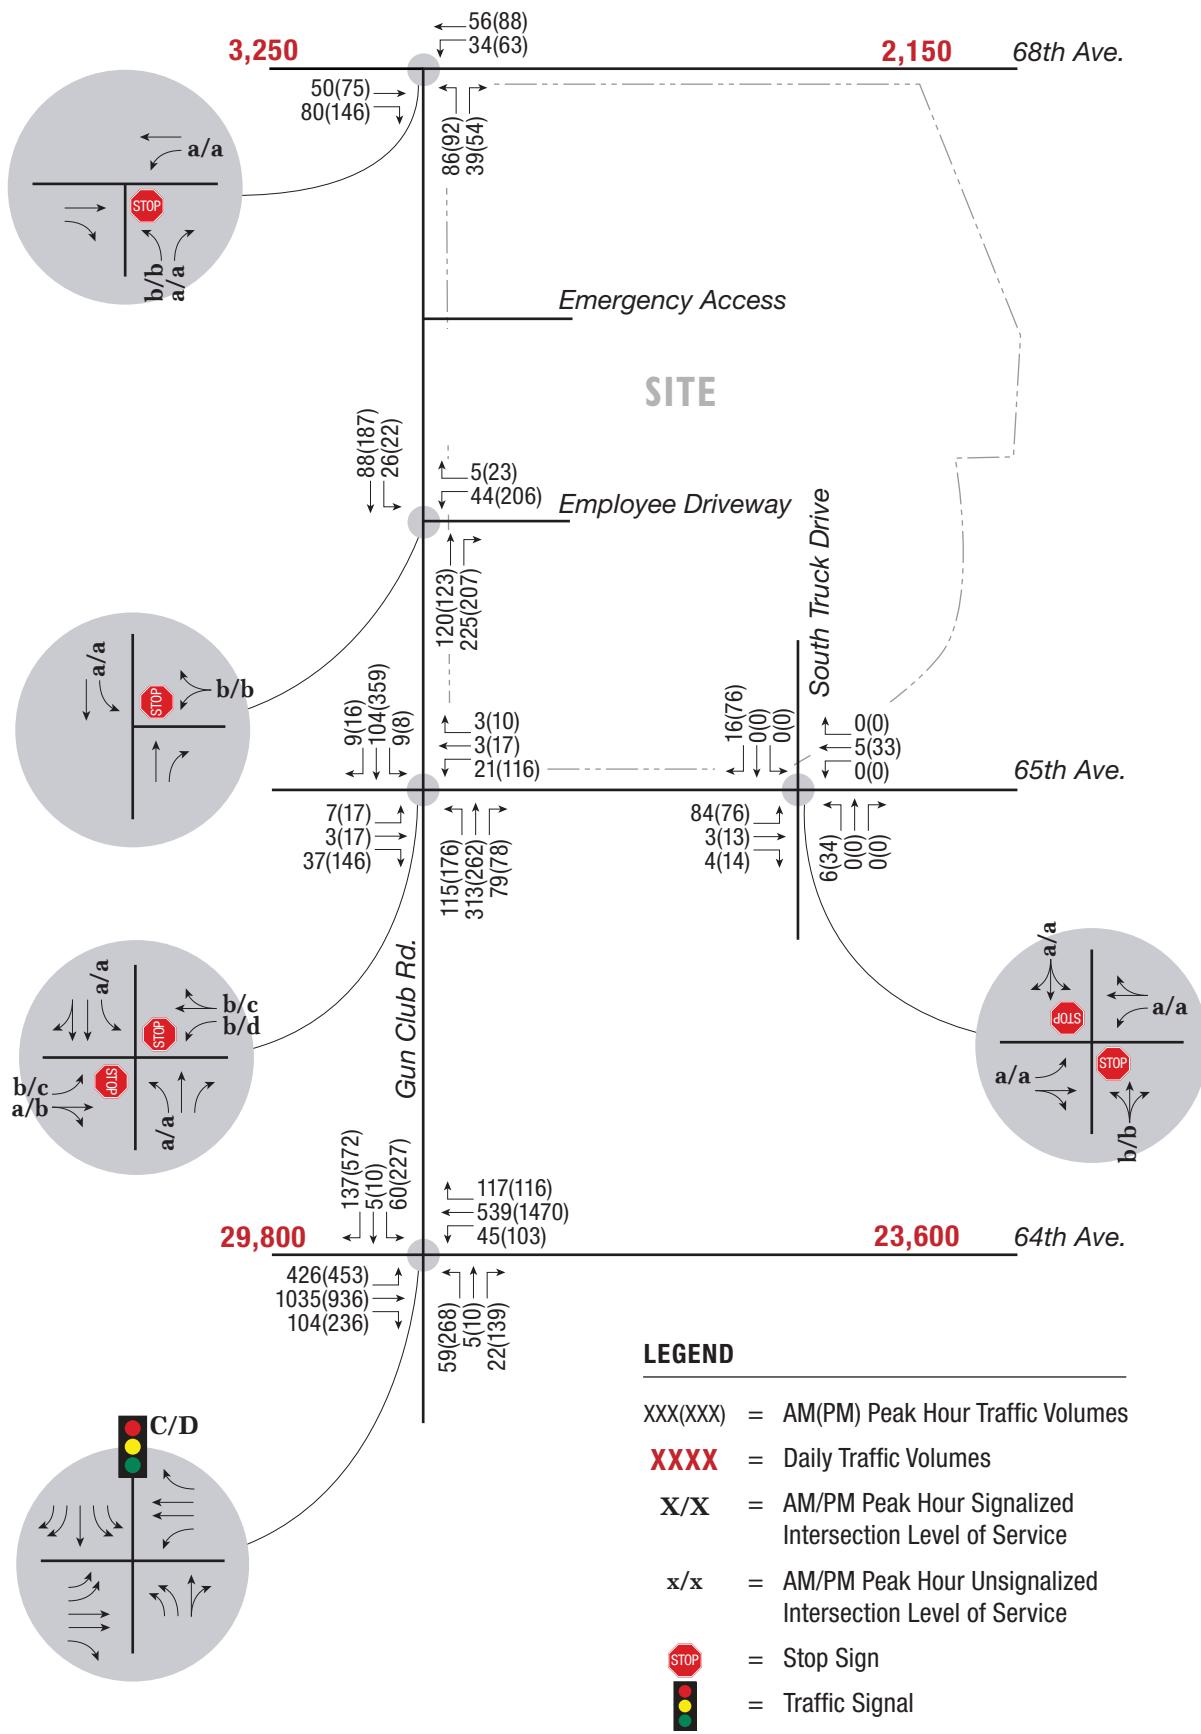

Intersection capacity analyses were conducted using the long-term total peak hour volumes and intersection geometrics as shown on **Figure 8**. **Appendix D** includes analysis worksheets. As indicated, traffic operations would remain acceptable at LOS D or better in the long-term.

Signalization of 64<sup>th</sup> Avenue/Gun Club Road intersection has been assumed for the long-term scenario based on previous analysis provided in the *High Point Master Plan Traffic Impact Study Analysis*.

### Gated Truck Access

The southern access on 65th Avenue is anticipated to serve truck traffic for this anticipated facility. Because this access is specifically for trucks using the facility, the heavy vehicle percentage at this access is anticipated to be 100 percent. This access is anticipated to be located on the south side of the development with the gate near the southeast corner of the planned building for trucks to access the truck court on the east side of the site. The area along the south side of the proposed building will provide about 1,000 feet of queueing space for trucks, which is enough space to accommodate approximately 20 trucks entering the facility. Based on other Dollar General Distribution Center sites this stacking area is more than adequate to serve entering truck demand on-site.

**FIGURE 8**  
**Long Term (2040) Total Traffic Conditions**

City of Aurora staff have asked for mitigation strategies for any signalized movement that falls below LOS D. As indicated on the analysis worksheets, the study area signalized intersection of Gun Club Road/64<sup>th</sup> Avenue has a natural cycle length of 80 and 110 seconds in the AM and PM peak, respectively. City staff have required a minimum of a 120-second cycle to fit with the recent citywide signal retiming project and to ensure that pedestrian crossing times can be accommodated. It is not feasible to alleviate these delays given a cycle length of 120 seconds. FHU recommends the consideration of lower cycle lengths at study area intersections. It should also be noted that the intersection analysis was done with a study area that did not include adjacent signals and, therefore, does not consider progression along the 64<sup>th</sup> Avenue corridor. Therefore, the results presented represent a worst-case scenario for eastbound and westbound traffic at the intersection. Given that the Dollar General Distribution Center is in conformance with previous trip generation estimates, it is FHU's recommendation that analysis from the previous 64<sup>th</sup> Avenue ISP remain the guiding document for construction of the Gun Club Road/64<sup>th</sup> Avenue intersection.

City of Aurora *Traffic Impact Study Guidelines* indicate that the Colorado Department of Transportation (CDOT) State Highway Access Code (SHAC) should be used to determine storage and taper lengths. These values generally yield overly conservative results and provide storage well in excess of 95<sup>th</sup> percentile queues (which already incorporate a heavy vehicle percentage), often by a factor of two to three. Rather, it is recommended that the values in **Table 2** corresponding to the 95<sup>th</sup> percentile lengths be used to determine storage lengths. Tapers of 144 and 120 feet, to provide the required 12:1 and 10:1 taper ratios for streets with posted speeds of 40 and 35 miles per hour (mph), respectively, should be added to the recommended storage lengths. These taper lengths correspond to the anticipated speed limits of 40 mph along 64<sup>th</sup> Avenue and 35 mph along Gun Club Road, 65<sup>th</sup> Avenue, and 68<sup>th</sup> Avenue.

Output from the traffic analysis effort was used to recommend the storage lengths shown in **Table 2**, using the following methodology:

- **Left-Turn Lane Storage Lengths** – At signalized intersections, the greater of the HCM 6<sup>th</sup> Edition or Synchro methodology queue calculations were reported. For unsignalized intersections, the HCM 6<sup>th</sup> Edition calculation was reported.
- **Through Movements** – For signalized intersections, Synchro calculation results were reported. No through movement queues are reported for unsignalized intersections as through movements are free.
- **Right-Turn Movements** – For signalized intersections, the Synchro queue length was used. HCM 6<sup>th</sup> Edition information was not used because HCM's signalized intersection methodology does not account for right turns on red. For unsignalized intersections, HCM 6<sup>th</sup> Edition calculation was reported.

**Table 2. Long-Term Future Dollar General Distribution Center Queueing**

## VI. SUMMARY AND RECOMMENDATIONS

M.A. Mortenson Company is proposing to develop an approximately 74-acre site within the High Point development in Aurora, Colorado, encompassing Planning Area (PA) 80 of the master development plan. The site is located along the east side of future Gun Club Road, bounded to the south by the future 65<sup>th</sup> Avenue and to the north by the future 68<sup>th</sup> Avenue. Access to the site will be provided via three full movement drives, two on future Gun Club Road and one on future 66<sup>th</sup> Avenue. An additional site emergency use only access point will be given into the truck court of the site via 66<sup>th</sup> Avenue along the eastern edge of the project site. The proposed development would consist of the approximately 920,000 square foot Dollar General Distribution Center.

The proposed development is estimated to generate approximately 3,000 trips per day, with an estimated 400 occurring during the AM peak hour and 610 occurring during the PM peak hour. This represents a nearly 60 reduction for daily and AM peak hour values as compared to the *High Point FDP Master Plan Traffic Study*; however, due to a shift change occurring during the PM peak, those values are anticipated to be similar to previous evaluations.

The potential traffic impacts of the development were evaluated under Long-Term Future (2040) conditions. This study assessed three public road intersections and two site access points with respect to peak hour traffic and LOS operations. There are no projected traffic operation issues in the long-term future planning horizon. Intersections are expected to operate acceptably at LOS D or better during peak hours.

64<sup>th</sup> Avenue will function acceptably as a four-lane major arterial, and Gun Club Road and 68<sup>th</sup> Avenue will function acceptably as three-lane collectors. Side-street stop control should operate acceptably at all study intersections with the exception of 64<sup>th</sup> Avenue with Gun Club Road. This intersection is anticipated to meet peak hour, four-hour, and eight-hour warrants for signalization based on previous analysis provided in both the *High Point FDP Master Plan Traffic Study* and the *Hyde Industrial TIS*. Signal warrants included in **Appendix A** indicate signals would be warranted under short-term background conditions.

Queuing at site access points is projected to be minimal. However, it is recommended that site access points be spaced a minimum of 150 feet from adjacent intersections.

## APPENDIX A. SIGNAL WARRANTS
