

Galloway

TRAFFIC IMPACT

56TH & PICADILLY MAP

Aurora, CO

Include discussion of future improvements along 56th Avenue and Picadilly Road. Who is responsible for specific improvements and when they will be constructed including additional lanes and signalization.

The Picadilly Road Widening Plans do not appear to consider the proposed access to align with Maxwell Place as 3/4 movement. The NB left turn lanes extend all the way to Maxwell Place so there would be no available room for a SB left turn lane at the proposed access to the site.

Consider pedestrian/bicycle crossing at proposed access to align with Maxwell Place. There is currently a bike lane along Maxwell Place along the west side of Picadilly. It is likely there will be demand for pedestrians and bicycles to cross Picadilly Road at this location to access the proposed development. Consider the Uncontrolled Pedestrian Crossing Guidelines and determine if additional treatment is needed based on spacing and projected traffic volumes.

Future improvements were included in Section IV and Section V. The Picadilly Widening plans were included in the background and total future scenarios. All Picadilly Rd street design, including the pedestrian/bicycle infrastructure, is being done by ARTA and AECOM under separate applications.

Executive Summary

Site Location and Study Area

The property that comprises the application area for the proposed development is approximately 26.95 acres in size and is identified as part of Adams County Parcel Number 182113200004. It is located south of E 56th Ave and east of Picadilly Rd in Aurora, CO. It is zoned Mixed-Use Airport (MU-A) and is currently vacant.

The study area is generally bounded by E 56th Ave to the north, Picadilly Rd to the west, and property lines to the east and south. The study area for the project includes intersections that could be affected by the proposed development:

- E 56th Ave & Picadilly Rd
- Maxwell Pl & Picadilly Rd
- E 54th Ave & Picadilly Rd
- Future Site Accesses

Description of Proposed Development

The Applicant seeks to develop the property with a mix of commercial/retail uses anchored by a grocery store use and gas station use. Site access is proposed via a $\frac{3}{4}$ movement at Maxwell Pl, a right-in right-out (RIRO) on Picadilly Rd, a signalized full movement access at E 54th Ave & Picadilly Rd, a RIRO access on E 56th Ave, and a signalized full movement access on E 56th Ave.

Conclusions and Recommendations

Conclusions

Based on the results of this traffic impact study, the following may be concluded:

- Under existing traffic conditions, the unsignalized intersection movements within the study area currently operate at overall acceptable levels of service (LOS) "C" or better during the weekday AM and PM peak hours except for the northbound and southbound movements at E 56th Ave & Picadilly Rd which operate at LOS "F". All queues remain within their respective storage lengths.
- Under background future 2026 and 2050 traffic conditions, without the development of the subject site, delays would increase at study intersections due to regional traffic growth. The signalized intersections are forecasted to operate at LOS "D" or better in 2026 and 2050 conditions with the exception of E 56th Ave & Picadilly Rd which would operate at LOS "E" in 2050 PM conditions due to regional growth. The unsignalized intersection movements are forecasted to operate at overall acceptable LOS "D" or better in 2026 and 2050 conditions with the exception of:
 - The EBLR approach at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 conditions.
 - The NBL movement at Maxwell Pl & Picadilly Rd which would operate at LOS "E" in 2050 conditions.
 - The EBL and SBR movements at E 56th Ave & Skydance Access which would operate at LOS "F" in 2050 PM conditions.

- Queues in background conditions remain within their respective storage lengths except for the EBL, WBL, WBR, and NBR movements at the intersection of E 56th Ave & Picadilly Rd in 2050 conditions.
- The proposed site development would generate, upon completion and full occupancy, 576 net new weekday AM and 910 net new weekday PM peak hour vehicle trips as well as 11,024 net new weekday daily trips.
- Under total future 2026 and 2050 traffic conditions with development of the site, the signalized intersections are forecasted to operate at LOS “D” or better in 2026 and 2050 conditions with the exception of E 56th Ave & Picadilly Rd which would operate at LOS “E” in 2050 PM conditions due to regional growth. The unsignalized intersection movements would operate at LOS “D” or better in 2026 and 2050 conditions with the exception of:
 - The EBR movement at Maxwell Pl & Picadilly Rd which would operate at LOS “E” in 2050 AM conditions.
 - The WBR movement at Maxwell Pl & Picadilly Rd which would operate at LOS “F” in 2050 PM conditions.
 - The NBL movement at Maxwell Pl & Picadilly Rd which would operate at LOS “E” in 2050 AM and PM conditions.
 - The SBL movement at Maxwell Pl & Picadilly Rd which would operate at LOS “F” in 2050 PM conditions.
 - The EBL movement at E 56th Ave & Skydance/N Site Access which would operate at LOS “F” in 2050 PM conditions.
 - The SBR movement at E 56th Ave & Skydance/N Site Access which would operate at LOS “E” in 2050 PM conditions.
- Queues in total future conditions remain within their respective storage lengths except for the EBL, WBL, WBR, and NBR movements at the intersection of E 56th Ave & Picadilly Rd in 2050 conditions.

Recommendations

- It is recommended that the Applicant provide access consistent with the site plan contained herein.
- Site access should be provided via:
 - SBL lane and NBTR lane at Maxwell Pl & Picadilly Rd.
 - SBL, NBR, and EBTR lane at E 54th Ave & Picadilly Rd.
 - EBTR and WBL lane at E 56th Ave & Road A.
 - EBTR lane at E 56th Ave & N Site Access.
 - NBTR lane at W Site Access & Picadilly Rd.

I. Introduction

Overview

This report presents the results of a Traffic Impact Study (TIS) conducted in support of a site plan to develop a mix of commercial/retail uses with a grocery store use and gas station use as an anchor in Aurora, CO. Currently the site is vacant. For planning and analysis purposes, Strip Retail, a Drive-In Bank, 3 Fast-Food Restaurants with Drive-Throughs, a Coffee Shop with Drive-Through, an Automobile Parts and Service Center, and an Automated Car Wash uses were assumed for the mix of commercial/retail uses on site.

Per the requirements of the City of Aurora, a TIS is required to support the proposed development.

Site Location and Study Area

The property that comprises the application area for the proposed development is approximately 26.95 acres in size and is identified as portion of Adams County Parcel Number 182113200004. It is located south of E 56th Ave and east of Picadilly Rd in Aurora, CO, as shown in Figure 1-1. It is zoned Mixed-Use Airport (MU-A) and is currently vacant. Site access is proposed via a $\frac{3}{4}$ movement at Maxwell Pl, a right-in right-out (RIRO) on Picadilly Rd, a signalized full movement access at E 54th Ave & Picadilly Rd, a RIRO access on E 56th Ave, and a signalized full movement access on E 56th Ave.

The Applicant seeks to develop the property with a Grocery Store and Gas Station use. The remainder of the site would be available for out parcel development and these lots were assumed as Retail stores, a Drive-In Bank, 3 Fast-Food Restaurants with Drive-Throughs, a Coffee Shop with Drive-Through, an Automobile Parts and Service Center, and an Automated Car Wash use. A reduction of the Applicant's proposed conceptual site plan is provided in Figure 1-2. A full-size copy of the plan is provided in Appendix A.

The study area is generally bounded by E 56th Ave to the north, Picadilly Rd to the west, and property boundaries to the east and south.

Tasks undertaken during this study included the following:

1. Reviewed the Applicant's proposed development plans and other background data.
2. Conducted a virtual field reconnaissance of existing roadway and intersection geometries, traffic controls, and speed limits.
3. Collected peak hour turning movement counts at the key intersections.
4. Analyzed existing levels of service at each of the key study intersections based on the methodologies set forth in the Highway Capacity Guidelines (HCM) 7th Edition and reports generated by Synchro as reported by Synchro version 12.
5. Forecasted background future traffic volumes based on baseline traffic counts, pipeline projects, and regional traffic growth for 2026 (build-out) and 2050 (long-range) conditions.
6. Calculated background levels of service at each of the key study intersections for the projected build-out years based on background future traffic forecasts, and the future lane use and traffic controls.

7. Estimated the number of AM and PM peak hour trips that would be generated by the proposed uses based on the Institute of Transportation Engineers (ITE) Trip Generation 11th Edition rates/equations and methodologies.
8. Prepared AM and PM peak hour total future traffic forecasts based on background traffic forecasts plus site traffic assignments for the 2026 (build-out) and 2050 (long-range) conditions.
9. Calculated total future levels of service for each of the key study intersections based on projected total future traffic forecasts, existing/future traffic controls and intersection geometries.
10. Identified roadway improvements required to accommodate future traffic volumes, as necessary.

Sources of data for this analysis included the Institute of Transportation Engineers (ITE) Trip Generation, 11th edition, the Highway Capacity Guidelines HCM 7th, Synchro 12, City of Aurora, Colorado, Adams County, and the files/library of Galloway.

Site Description and Access

Site Conditions

The terrain proximate to and surrounding the site is generally classified as "level".

Hazardous Conditions

Based on the field reconnaissance in the vicinity of the subject site, no hazardous features or constraints were identified.

Proposed Site Access

Access to the site is proposed via:

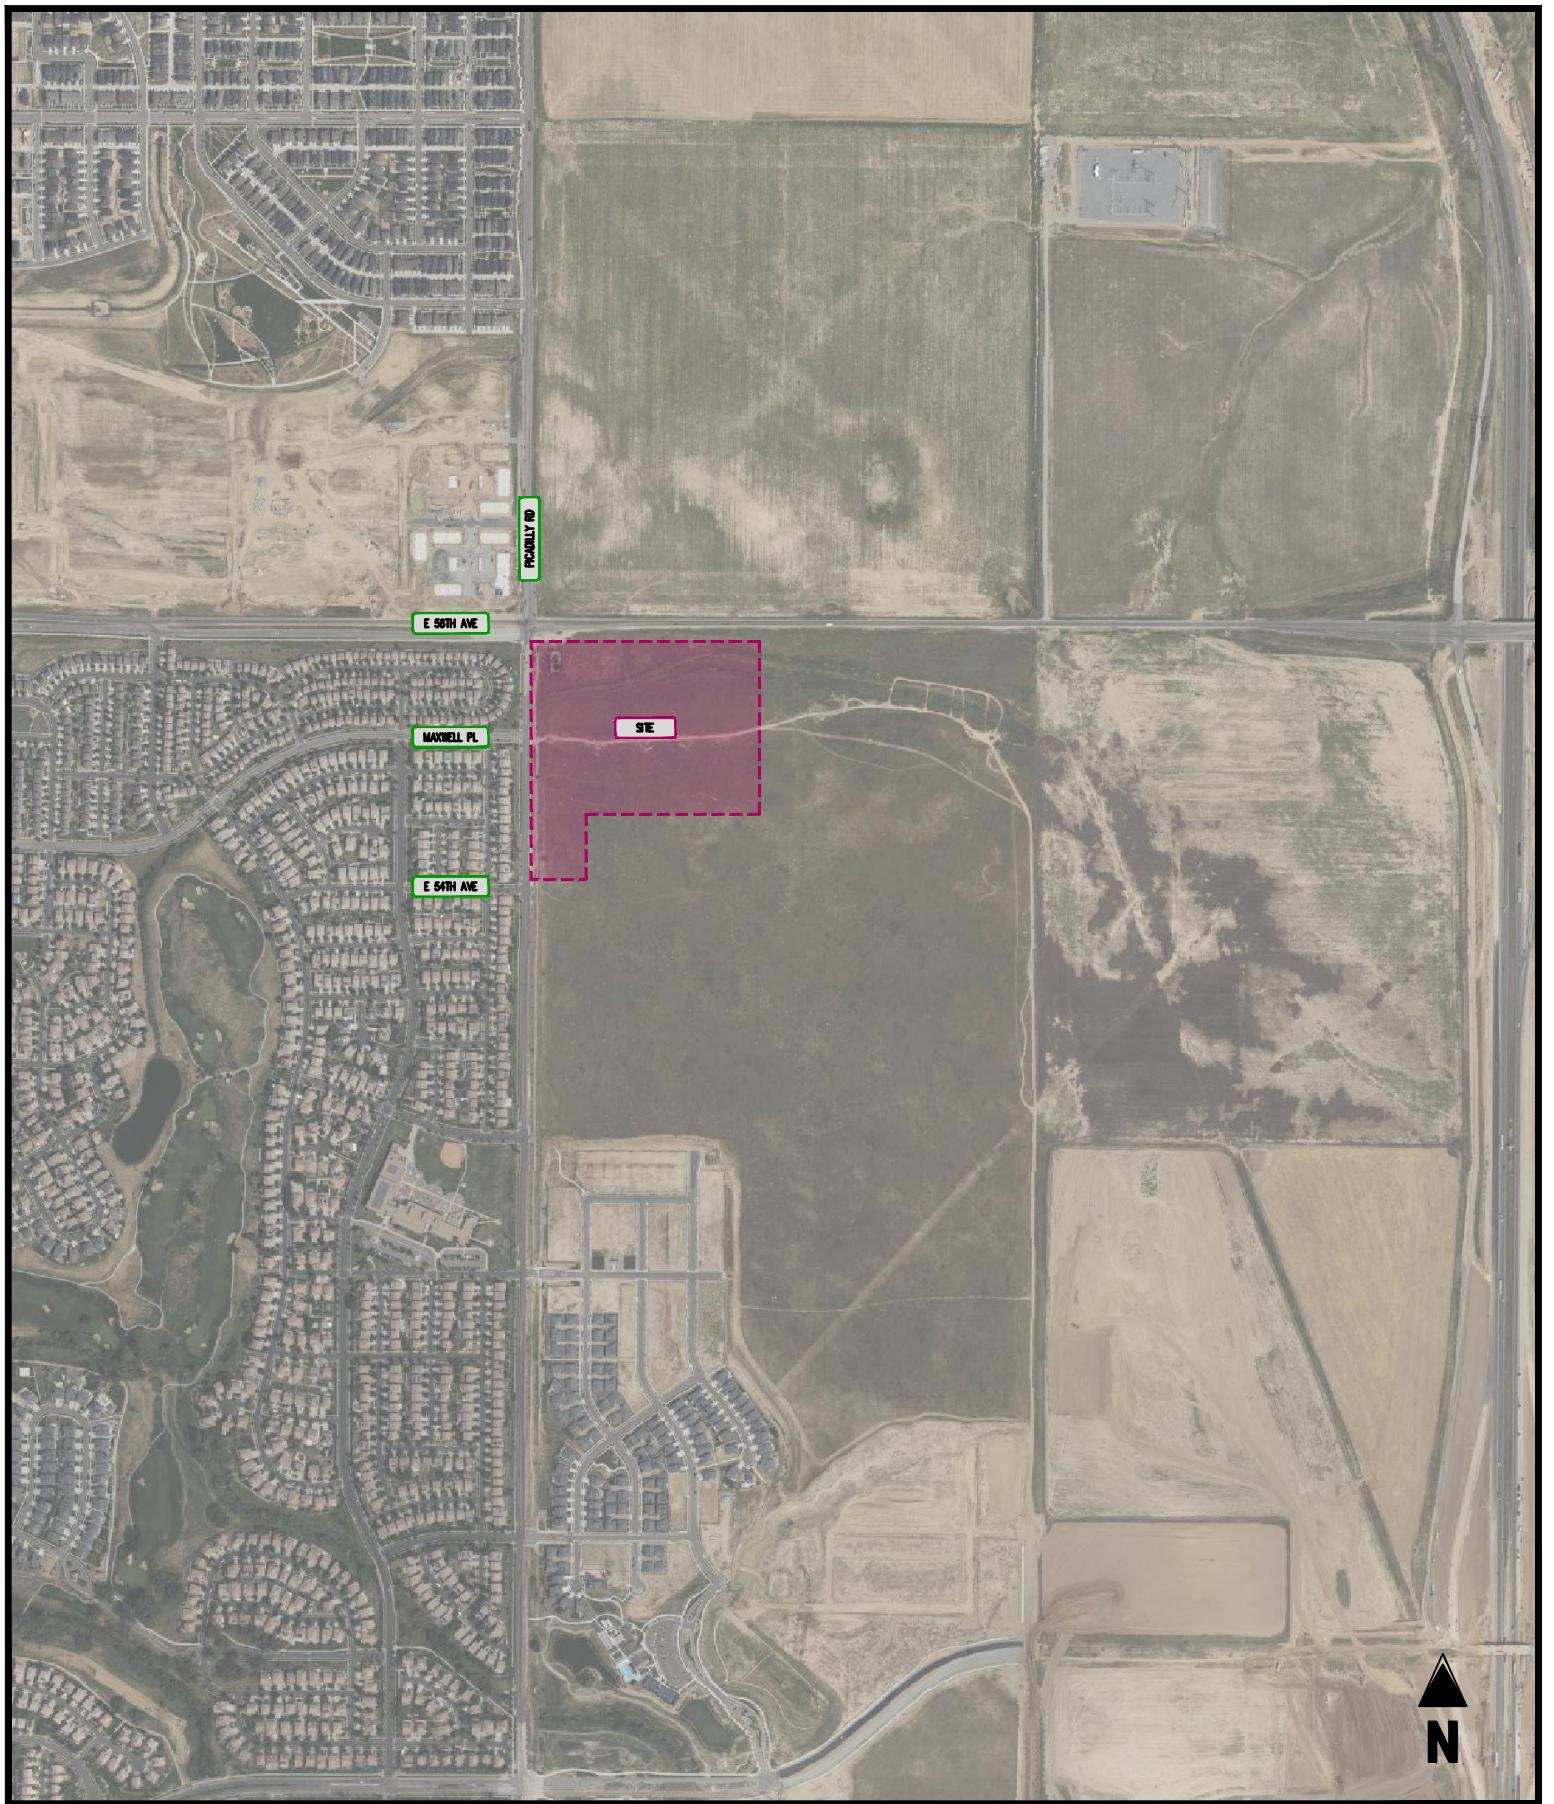

- An additional east leg of the Maxwell PI & Picadilly Rd intersection which will operate as a $\frac{3}{4}$ movement stop-controlled intersection.
- An additional east leg of the E 54th Ave & Picadilly Rd intersection which will operate under signalized control.
- A new right-in right-out (RIRO) access on Picadilly Rd between Maxwell PI and E 54th Ave that will operate under stop control.
- A new RIRO access on E 56th Ave that will operate under stop control.
- A new signalized full movement intersection on E 56th Ave.

Existing Zoning

The subject site is currently zoned Mixed-Use Airport (MU-A) and is currently vacant. Figure 1-3 depicts the existing zoning associated with the subject property, as well as neighboring properties as shown on the Town of Aurora zoning map.

Nearby Uses

The developed properties west and south of the subject site are mostly residential, and the other properties surrounding the subject site are generally planned to be developed with commercial and residential uses. The proposed uses would be consistent with area development.

EXISTING ZONING

II. Background Information

Study Area

The study area was determined by a review of intersections that would experience a significant portion of turning movement volumes generated by the site. As such, the traffic study focuses primarily on the following intersections:

Study Intersections

- E 56th Ave & Picadilly Rd
- Maxwell PI & Picadilly Rd
- E 54th Ave & Picadilly Rd
- Future Site Accesses

Study Assumptions

For purposes of this analysis only, the proposed use was assumed to be built and occupied in one distinct phase. It was assumed that the use would be built and operational in the study year 2026. A long-term analysis of 2050 is also provided.

Study Methodology

Synchro software version 12 was used to evaluate levels of service at each of the study intersections during the weekday AM and PM peak hours. Synchro is a macroscopic model used for optimizing traffic signal timing and performing capacity analyses. The software can model existing traffic signal timings or optimize splits, offsets, and cycle lengths for individual intersections, an arterial, or a complete network. Synchro allows the user to evaluate the effects of changing intersection geometrics, traffic demands, traffic control, and/or traffic signal settings as well as optimize traffic signal timings.

The levels of service reported for the signalized and unsignalized intersections analyzed herein were taken from the Highway Capacity Manual (HCM) 7th and reports generated by Synchro. Level of service descriptions are included in Appendix B.

A default percent heavy vehicle (%HV) factor of 2% was used for all movements in the study area.

Existing Roadway Network

Regional access to the subject site is provided by E 56th Ave, and local access is provided via Picadilly Rd. Maxwell PI and E 54th Ave are local roads that connect the residential neighborhood to Picadilly Rd. Figure 2-1 depicts existing lane use and traffic controls in the vicinity of the subject site. The following provides a description of each of the roadways within the study network.

E 56th Ave

E 56th Ave is constructed as a four-lane median divided section to the west of the subject site and as a two-lane section to the east of the site with turn lanes at major intersections. The posted speed limit is 45 mph in the vicinity of the subject site. The roadway functions as a Major Arterial and provides east west connection through the region. The intersection with Picadilly Rd currently operates under STOP control.

there are existing bike lanes along Maxwell Place west of Picadilly Road. how will the pedestrian/bike connection be accommodated with the proposed development? it is likely there will be demand to access the new commercial development to the east from the existing residential. consider Uncontrolled Pedestrian Crossing Guidelines and if additional treatment is needed at Maxwell Place.

Picadilly Rd

Picadilly Rd is constructed as a two-lane roadway. The posted speed limit is 30 mph. The roadway functions as a Major Arterial providing access to the subject site. The roadway is to provide connection to the residential neighborhood located west of the subject site. The intersections in the vicinity of the subject site operate under STOP control.

All Picadilly Rd street design, including the pedestrian/bicycle infrastructure, is being done by ARTA and AECOM under separate application.

Maxwell PI

Maxwell PI is constructed as a two-lane roadway in the vicinity of the subject site with a speed limit of 30 mph. The roadway is to provide connection to the residential neighborhood located west of the subject site. The intersections along its length operate under STOP control.

E 54th Ave

E 54th Ave is constructed as a two-lane roadway in the vicinity of the subject site with no posted speed limit. The roadway is to provide connection to the residential neighborhood located west of the subject site. The intersections along its length operate under STOP control.

III. Analysis of Existing Conditions

Traffic Volumes

Weekday AM and PM peak hour traffic volumes counts were conducted on Thursday September 12, 2024, from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM for the Maxwell Pl & Picadilly Rd intersection and from 7:00 AM to 7:00 PM for the E 56th Ave & Picadilly Rd and E 54th Ave & Picadilly Rd intersections by IDAX Data Solutions.

The existing volumes are summarized in Figure 3-1. Copies of traffic counts are included in Appendix C. Existing peak hour factors (PHF) were also computed by approach from the traffic counts and applied to the analysis with a minimum of 0.85 and a maximum of 0.92.

Operational Analysis

Capacity/level of service (LOS) analyses were conducted at the study intersections based on the existing lane use and traffic controls shown in Figure 2-1 and existing baseline vehicular traffic volumes shown in Figure 3-1. The capacity analysis results are presented in Appendix D and summarized in Table 3-1 and in Figure 3-2.

As shown in Table 3-1, the stop-controlled intersection movements operate at LOS “C” or better during the weekday AM and PM peak hours except for the northbound and southbound movements at the E 56th Ave & Picadilly Rd intersection which operate at LOS “F”.

Existing Intersection Queues

An analysis of intersection 95th-percentile queues was performed at key locations. The results of the queuing analysis, as reported by Synchro, are summarized in Table 3-2. As shown in the table, queues are contained within their effective storage.

IV. Analysis of Future Conditions without Site Development

Methodology

The future traffic forecasts, without the proposed new use, were developed for 2026 and 2050 conditions based on a composite of existing baseline traffic volumes, pipeline developments, and regional traffic growth. A 5.0% growth factor per year was applied to movements of existing traffic on the study intersections.

Regional Growth

Increases in traffic associated with regional growth was assumed as 5.0 percent per year compounded for movements on study intersections up to 2026 as well as to 2050 per the Green Valley Master Plan (MP) Traffic Impact Study (TIS) performed by Felsburg Holt & Ullevig in September 2023. This growth accounts for increases in traffic resulting from influences outside of the immediate study area. The resulting increases in volumes within the study area are reflected in Figure 4-1 for 2026 conditions and Figure 4-2 for 2050 conditions.

Pipeline Developments

Approved but unbuilt/unoccupied (i.e., “pipeline”) developments were identified for consideration within the study. The location of the pipeline developments in relation to the Applicant’s property is shown in Figure 4-3. The Green Valley MP TIS was last updated in September 2023, and the Skydance Development TIS was last updated February 2022.

The Green Valley MP is the master study for the ~290-acre area which includes the current site that is being analyzed. The following pipeline development and development program was included in the background and total future analysis for 2026 and 2050 conditions:

Green Valley Master Plan

327	DU	Senior Housing Attached
1,067	DU	Multi-Family (Low-Rise)
24	DU	Single Family Detached
30	DU	Single Family Attached
2,100	SF	Fast-food Restaurant with Drive-Through
377,268	SF	General Office
197,579	SF	Shopping Plaza (40-150k)
121,999	SF	Strip Retail Plaza (<40k)
8	FP	Gas Station with Convenience Store
1,904	SF	High-Turnover Sit-Down Restaurant
100	Rooms	Hotel
111,000	SF	Hardware Store
9,100	SF	Medical Office Building
12,000	SF	Day Care

Pipeline development site trips were obtained from removing the assumed uses for the current site area from the Green Valley MP TIS. This site was accounted for in planning areas 47 and 53 in the Master Plan and had assumed uses of 220 DU of Multi-Family (Low-Rise) use, 42,600 SF of Strip Retail Plaza (<40k) use, 25,800 SF of Shopping Plaza (40-150k) use, 124,000 SF of Grocery Store use, 40,000 SF of Fitness Center Use, and a 10 FP Gas Station use. The trips for these uses were tabulated and removed from the

total Master Plan trips and the pipeline trips were calculated for the trips to and from the other areas/sites of the master plan.

The Skydance Development is located directly north of the site. The following pipeline development and development program was included in the background and total future analysis for 2050 conditions:

Skydance Development TIS

163	DU	Single-Family Homes (Detached)
197	DU	Townhomes
1,236	DU	Multi-Family Homes
197,850	SF	Commercial Retail
64,000	SF	Supermarket
12	FP	Gas Station with Convenience Store Use
640	SF	Car Wash
4,750	SF	Fast-Food Restaurant

The pipeline trips are shown in Figure 4-4 for 2026 conditions and Figure 4-5 for 2050 conditions.

The intersections of E 56th Ave & Picadilly Rd, E 54th Ave & Picadilly Rd, and E 56th Ave & Road A were identified in the Pipeline TIS's to be signalized once developments are completed. Relevant excerpts from the pipeline developments TIS's are included in Appendix E.

The background future lane uses and traffic control was determined from the Green Valley Master Plan and can be seen in Figure 4-6 for 2026 conditions and Figure 4-7 for 2050 conditions.

Background Traffic Forecasts

The existing traffic forecasts depicted in Figure 3-1, the regional growth shown in Figure 4-1 (2026) and Figure 4-2 (2050), and the pipeline development site trips shown in Figure 4-4 (2026) and Figure 4-5 (2050) were added together to yield the background future traffic forecasts shown in Figure 4-8 for 2026 conditions and Figure 4-9 for 2050 conditions.

Background Future Levels of Service

Capacity analyses of 2026 and 2050 future traffic conditions without the proposed development are provided in Appendix F and summarized in Table 4-1. The forecasted levels of service are also depicted graphically in Figure 4-10 for 2026 conditions and Figure 4-11 for 2050 conditions.

As shown on Table 4-1, the stop-controlled intersection movements would operate at overall acceptable LOS "C" or better in 2026 and LOS "D" or better in 2050 with some exceptions. Those exceptions include:

- The eastbound approach at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 conditions due to regional growth.
- The northbound left movement at Maxwell Pl & Picadilly Rd would operate at LOS "F" in 2050 conditions due to regional growth.
- The eastbound left and southbound right movements at E 56th & Picadilly Rd would operate LOS "F" in 2050 PM conditions.

Need a section discussing future lane use and control. This would include the Picadilly Road Widening project by the City of Aurora from 38th to 56th. When is this project anticipated to be completed and what improvements does it include in the site vicinity - specifically at the intersection of 56th & Picadilly. The current plans show the proposed access to the east, aligning with Maxwell Place, as a right-in/right-out. No southbound left turn lane is planned. The dual northbound lefts at 56th extend 250', with no room for a southbound left at Maxwell Place.

A section discussing future lane use and traffic control was included in Section IV and Section V. The Picadilly Road Widening Project was assumed to be completed by 2026 conditions. The ¾ movement at Maxwell Pl & Picadilly Rd was removed therefore the southbound left turn lane would be removed and the dual northbound left turns could extend to 250'.

The signalized intersections are forecasted to operate at overall acceptable LOS "D" or better in 2026 and 2050 conditions with the exception of the E 56th Ave & Picadilly Rd intersection which would operate at LOS "E" in 2050 conditions due to regional growth.

Background Future Queueing

An analysis of intersection queues was performed at key locations under background future traffic conditions. The results of the queuing analysis are summarized in Table 4-2.

As shown in the table, queues within the study network will increase due to regional traffic growth. All queues are expected to be contained in their effective storage with the exception of the E 56th Ave & Picadilly Rd intersection of which the WBL and NBR movements in the 2050 AM conditions and the EBL, WBL, WBR, and NBR movements in the 2050 PM conditions would exceed the available storage.

Operational and queueing deficiencies have been identified for 2050 long range conditions and suggests that further study should be required as development occurs in the area.

Include planned improvements as part of the Picadilly Road Widening project. Existing storage, planned storage with the project, and what is needed. Also, please indicate where future storage will exceed what is existing and/or planned for the future.

A section discussing future lane use and traffic control was included in Section IV and Section V. Existing storage is shown in Table 3-2 Existing Queues, and planned storage with the project is shown in Table 4-2 and 6-2. Where storage will exceed existing/planned length is highlighted in the queue tables (Table 4-2 and Table 6-2).

V. Site Analysis

Overview

The Applicant is proposing to develop the approximately 26.95-acre site with a mix of commercial/retail uses. For purposes of this study, the site is assumed complete and occupied in 2026. For analysis purposes the following use and development programs were assumed:

Build-Out 2026:

168,117	SF	Shopping Center (>150k)
18	FP	Gas Station
4,750	SF	Drive-In Bank
4,500	SF	Fast-Food Restaurant w/Drive Thru
1,500	SF	Coffee Shop w/Drive-Thru
4,500	SF	Fast-Food Restaurant w/Drive Thru
3,700	SF	Fast-Food Restaurant w/Drive Thru
7,200	SF	Automobile Parts and Service Center
1	TUNNEL	Automated Car Wash

Why didn't you use the ITE Land Use Code for Grocery Store since that land use has been specifically identified?

If these uses correlate with specific Lots on the site plan, please identify so we can make sure the site plan matches what is being proposed within this study.

Proposed Site Access

As shown on the Applicant's conceptual plan (Figure 1-2) via:

- An additional east leg of the Maxwell PI & Picadilly movement stop-controlled intersection.
- An additional east leg of the E 54th Ave & Picadilly signalized control.
- A new right-in right-out (RIRO) access on Picadilly to operate under stop control.
- A new RIRO access on E 56th Ave that will operate under stop control.
- A new signalized full movement intersection on E 56th Ave.

The Shopping Center ITE Land Use Code was used to encompass the grocery store, retail lot to the west of the grocery store, and the Jr Anchor lot (Lot 2) to the east of the grocery store. The other assumed uses are not coordinated with specific lots, but to be conservative with trip generation, each lot was assumed have one (1) use.

The proposed lane use and traffic control are shown in Figure 5-1 for 2026 and Figure 5-2 for 2050.

Trip Generation

Overview

Trip generation estimates for the weekday AM and PM peak hours, as well as the weekday average daily traffic (ADT), were derived from the standard Institute of Transportation Engineers (ITE) [Trip Generation Manual](#) rates/equations, as published in the 11th edition. The trip generation analysis is presented in Table 5-1.

Pass-by Trips

According to ITE, in some cases the driveway volumes at a particular land use are different from the amount of traffic added to the adjacent street system. Uses such as retail establishments attract a portion of their trips from traffic that is already present on the road network. Pass-by trips are those trips which are made as intermediate stops on the way to a primary destination. An example of a pass-by trip would be one in which a driver stops at a coffee shop on his/her way to work.

Some of the proposed uses would experience pass-by trips consistent with the primary uses located on site. In recognition of this phenomenon and consistent with ITE published data, the following pass-by reductions were applied to the trip generation analysis:

- Shopping Center: 0% AM / 29% PM
- Gas Station: 63% AM / 57% PM
- Drive-In Bank: 29% AM / 35% PM
- Fast-Food Restaurant w/Drive-Thru: 50% AM / 55% PM
- Coffee Shop w/Drive-Thru: 50% AM / 55% PM

As shown in Table 5-1, the site in total is anticipated to generate 481 weekday AM, and 655 weekday PM peak hour pass-by trips. Therefore, these trips would be drawn from the existing road network and assigned to the future site entrances accordingly. Pass-by trip assignments at key study intersections are shown in Figure 5-3.

Net Site Trips

The vehicle trips that would be generated by the proposed development plan are summarized in Table 5-1. As shown in Table 5-1, the site would generate upon completion and full occupancy 576 net new weekday AM and 910 net new weekday PM peak hour vehicle trips, as well as 11,024 net new weekday daily trips.

Site Trip Distributions

The distribution of the anticipated trips generated by the completion of the proposed development was based on the Green Valley MP. Existing travel patterns indicate the following distribution is appropriate in the forecasting of future site traffic:

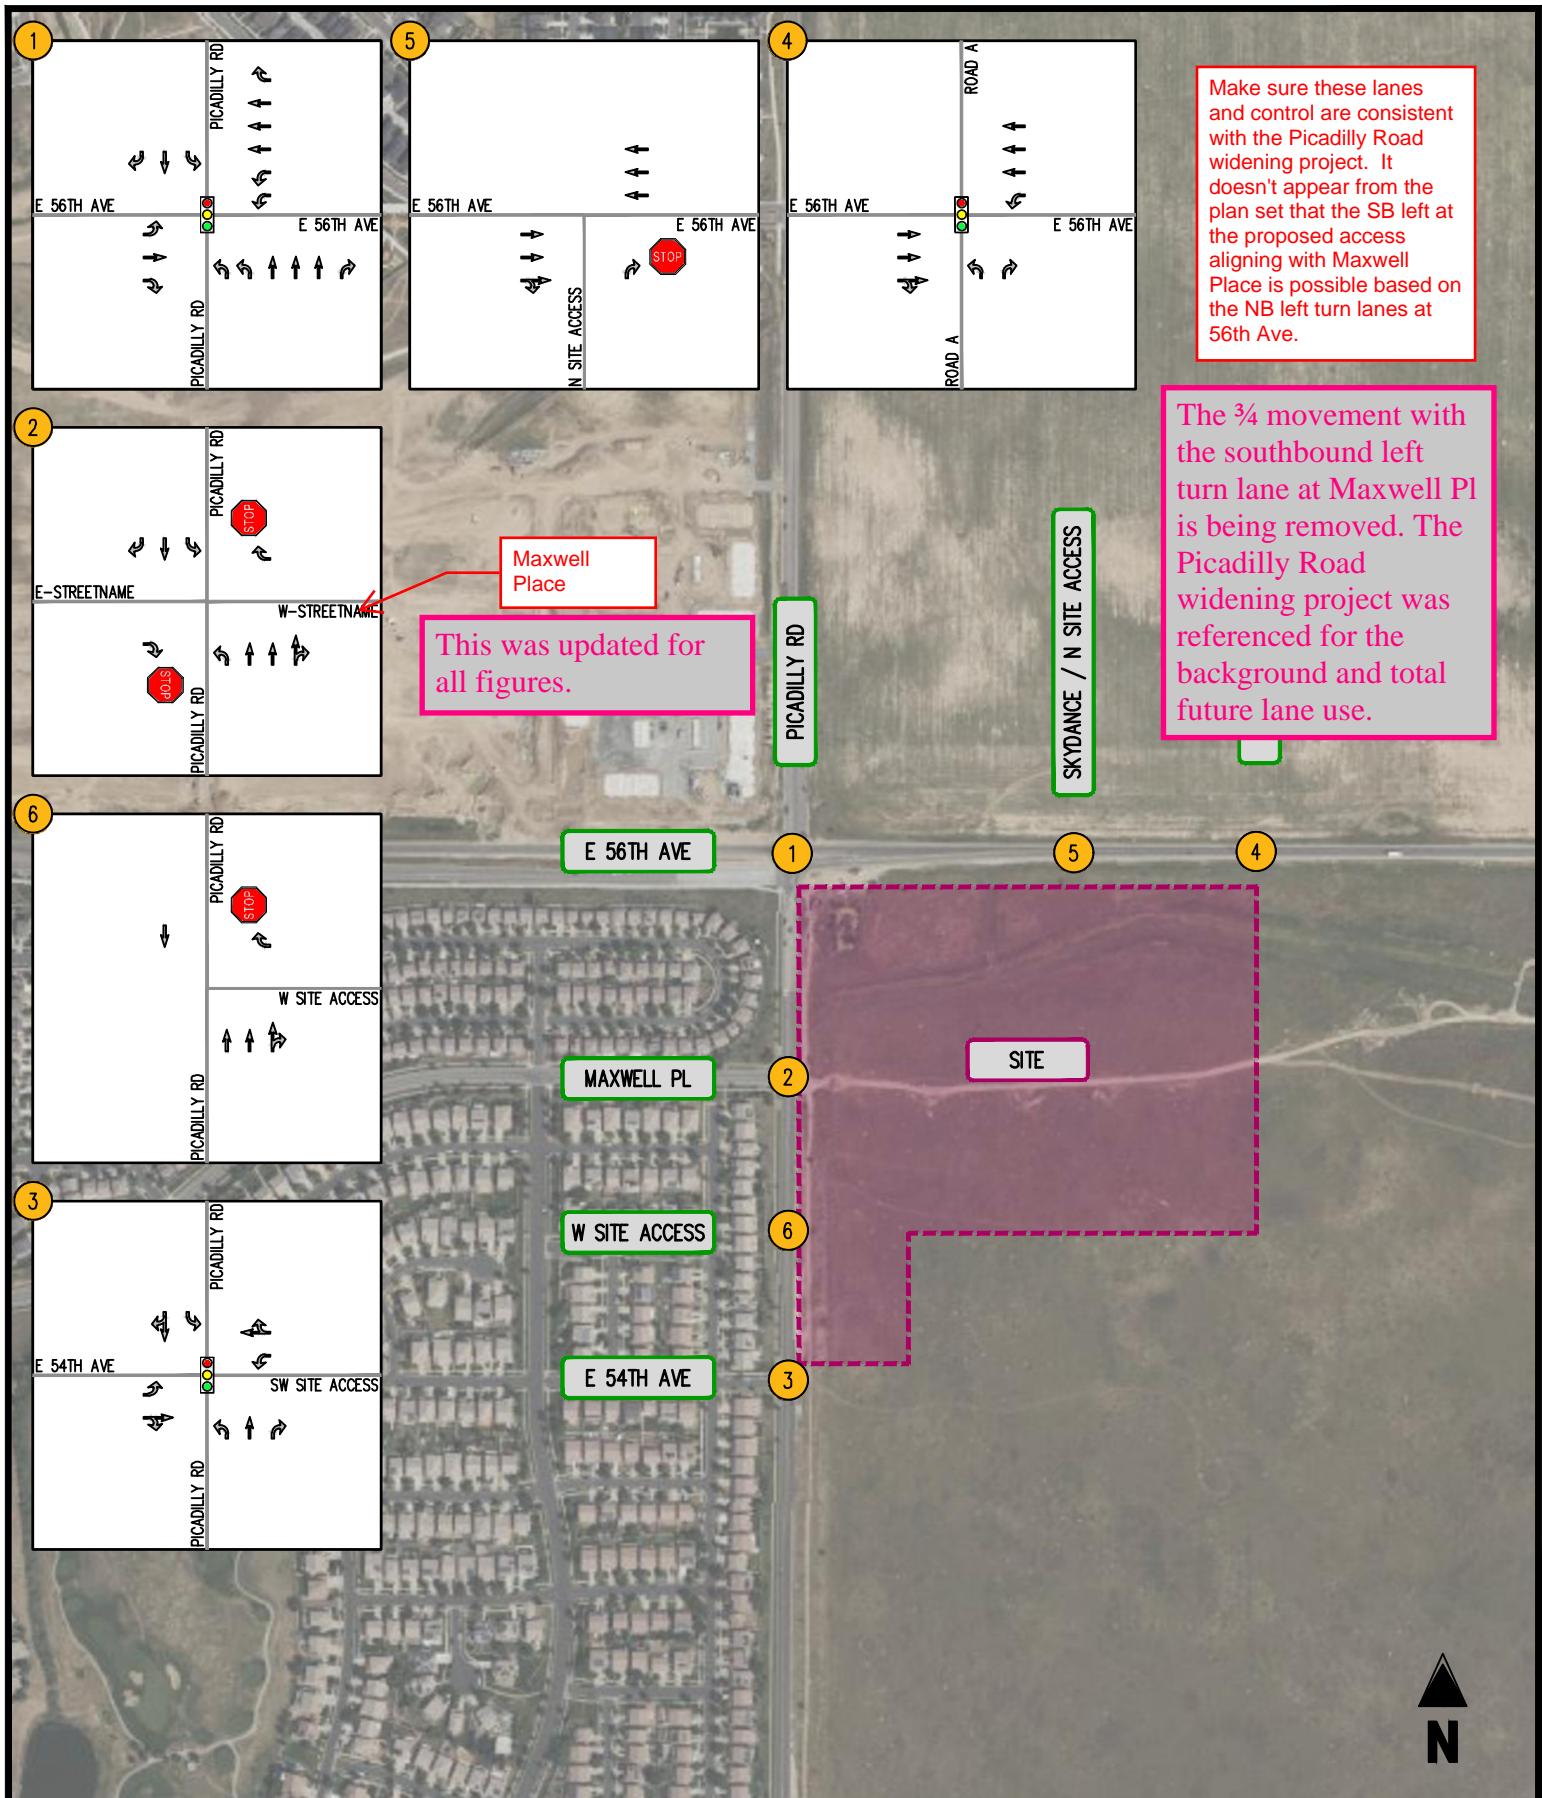

- To/from the west on E 56th Ave: 10%
- To/from the east on E 56th Ave: 30%
- To/from the north on Picadilly Rd: 5%
- To/from the south on Picadilly Rd: 55%

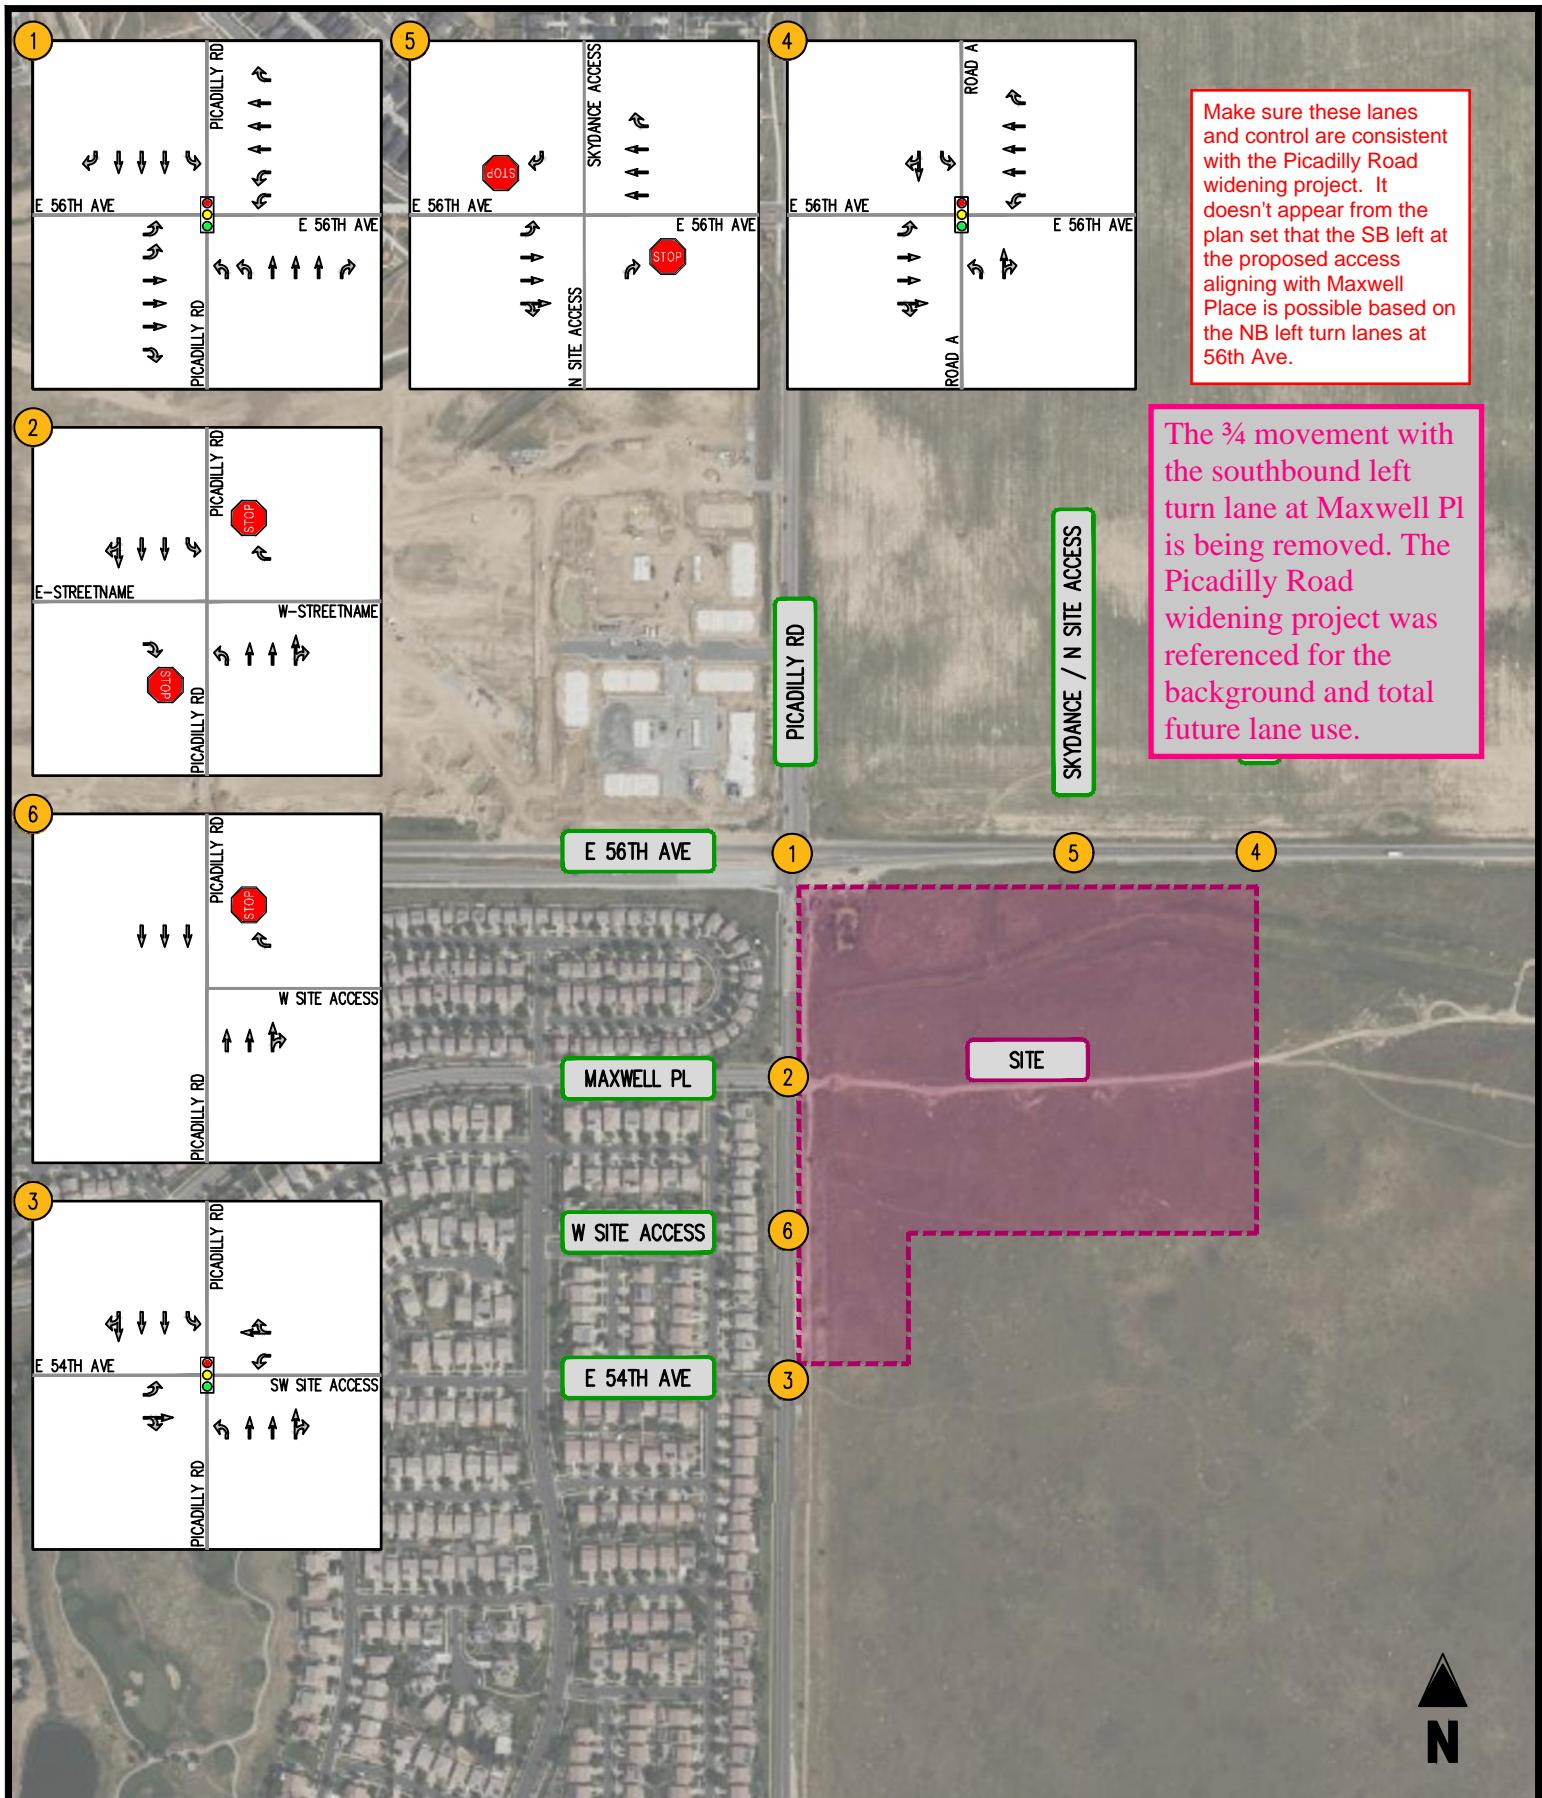

Discussion of pass-by trip distribution - directional percentages along 56th & Picadilly. Was it directional based on time day?

No, the trip distributions were the same for the AM & PM peak hours.

Site Trip Assignments

The assignment of the new vehicle trips generated upon the future build-out of the development project was based on the above distribution. The net new trips assignments are depicted in Figure 5-4.

Site Trip Generation ⁽¹⁾

The conceptual site plan refers to lots. Is it possible to correlate the Pads described below to the Lots on the site plan. Also - for the ITE Land Use Code Shopping Center, does this correspond to the grocery store? Why didn't you use the ITE Land Use Code for grocery store? Also - the square footage below does not match the site plan.

VI. Analysis of Future Conditions with Site Development

Total Future Traffic Forecasts

The 2026 and 2050 total future traffic forecasts associated with the proposed development were developed by combining the background future forecasts shown in Figure 4-8 (2026) and Figure 4-9 (2050), the pass-by trips shown in Figure 5-3, and the site trip assignments shown in Figure 5-4. The resulting total future traffic forecasts are provided in Figure 6-1 for 2026 conditions and Figure 6-2 for 2050 conditions.

Total Future Levels of Service with Proposed Development

Future levels of service with the proposed development plan were estimated at key study intersections based on the future traffic volumes shown in Figures 6-1 (2026) and Figure 6-2 (2050), the total future lane use in Figure 5-1 (2026) and Figure 5-2 (2050), and the HCM 7th methodologies for signalized and unsignalized intersections. The results of these analyses are provided in Appendix G and presented in Table 6-1. Total future levels of service are also presented graphically in Figure 6-3 (2026) and Figure 6-4 (2050).

As shown in Table 6-1, levels of service under future site development conditions would remain generally consistent with future background conditions (i.e., without site development). Overall delays would experience an increase due to site trips. The signalized intersections within the study area would continue to operate at overall acceptable LOS "D" or better in 2026 and 2050 conditions with the exception of the E 56th Ave & Picadilly Rd intersection which would operate at LOS "E" in 2050 conditions. The unsignalized intersection movements in the study area are forecasted to operate at LOS "D" or better in 2026 and 2050 conditions with some exceptions. Those exceptions include:

- The eastbound right movement at Maxwell Pl & Picadilly Rd which would operate at LOS "E" in 2050 AM conditions due to regional growth.
- The westbound right movement at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 PM conditions due to regional growth.
- The northbound left movement at Maxwell Pl & Picadilly Rd which would operate at LOS "E" in 2050 AM and PM conditions due to regional growth.
- The southbound left movement at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 PM conditions due to regional growth.
- The eastbound left movement at E 56th Ave & Skydance/N Site Access which would operate at LOS "F" in 2050 PM conditions.
- The southbound right movement at E 56th Ave & Skydance/N Site Access which would operate at LOS "E" in 2050 PM conditions.

Total Future Queuing

Total future queues were forecasted using Synchro software. The results of the queuing analysis are summarized in Table 6-2. The forecasted queues are expected to be contained in their effective storage with the exception of the E 56th Ave & Picadilly Rd intersection of which the WBL and NBR movements in the 2050 AM conditions and the EBL, WBL, WBR, and NBR movements in the 2050 PM conditions would exceed the available storage, consistent with background conditions.

Signal Warrants

The Manual on Uniform Traffic Control Devices (MUTCD) contains nine traffic signal warrants that help determine if installing a traffic signal at a particular location is justified. The Signal Warrants are listed below.

- #1 – Eight-Hour Vehicular Volume
- #2 – Four-Hour Vehicular Volume
- #3 – Peak Hour
- #4 – Pedestrian Volume
- #5 – School Crossing
- #6 – Coordinated Signal System
- #7 – Crash Experience
- #8 – Roadway Network
- #9 – Intersection Near a (Railroad) Grade Crossing

The Eight-Hour Vehicular Volume (#1), Four-Hour Vehicular Volume (#2), and the Peak Hour (#3) warrants were used to analyze the intersections of E 56th Ave & Picadilly Rd, E 54th Ave & Picadilly Rd, and E 56th Ave & Road A. The other Signal Warrants are either not applicable, or it is not possible at this time to accurately forecast the data needed to evaluate a particular Signal Warrant.

12-hour counts were taken at the intersections of E 56th Ave & Picadilly Rd and E 54th Ave & Picadilly Rd from 7:00 AM to 7:00 PM. Since the intersection of E 56th Ave & Road A is not yet constructed, the eastbound/westbound volumes were calculated using the 12-hour counts from the E 56th Ave & Picadilly Rd intersection. These existing volume counts were used along with the proposed new AADT of the site, the site trip distributions, and the hourly distribution of vehicle trips for Shopping Centers (Land Use Code 820) from the ITE Trip Generation Manual 11th Edition to forecast the hourly approach volumes at each intersection for an average day. These values were used for Warrants #1 and #2. Pipeline development trips were not considered in these warrant analyses. All signal warrant analysis tables and graphs are included in Appendix H.

E 56th Ave & Picadilly Rd

Warrant 1 (Eight-Hour Vehicular Volume) was met for this intersection in existing conditions due to the high volume of traffic on both E 56th Ave and Picadilly Rd. The existing volumes for every hour from 7:00 AM – 7:00 PM were calculated for the major road and each minor road approach and were compared to Table 4C-1 from the MUTCD. All twelve of the hours exceeded the requirements for Condition A-Minimum Vehicular Volume.

Warrant 2 (Four-Hour Vehicular Volume) was met for this intersection during existing conditions since there were over four hours that the major/minor street volumes fall above the '1 lane & 1 lane' curve in Figure 4C-2.

Warrant 3 (Peak Hour) was met for this intersection with existing conditions. Both the AM and PM peak hour volumes fell above the '1 lane & 1 lane' curve in Figure 4C-4.

E 54th Ave & Picadilly Rd

Warrant 1 (Eight-Hour Vehicular Volume) was met for this intersection in total future conditions with the site development in 2026 and 2050. The projected volumes for every hour from 7:00 AM – 7:00 PM were calculated for the major road and each minor road approach and were compared to Table 4C-1 from the MUTCD. Ten of the hours exceeded requirements for Condition A – Minimum Vehicular Volume.

Warrant 2 (Four-Hour Vehicular Volume) was met for this intersection during total future conditions in 2026 and 2050 since there were over four hours that the major/minor street volumes fall above the '1 lane & 1 lane' curve for 2026 and the '2 or more lanes & 1 lane' curve for 2050 shown in Figure 4C-1. The graph for Warrant 2 is provided in Appendix H with volumes plotted for future conditions; due to high projected 2050 volumes, those plotted points do not appear on the graph provided.

Warrant 3 (Peak Hour) was met for this intersection with background 2050 and total future 2026 and 2050 conditions. The total future AM and PM peak hour volumes fell above '1 lane & 1 lane' curve for 2026 and the '2 or more lanes & 1 lane' curve for 2050 shown in Figure 4C-3. The graph for Warrant 3 is provided in Appendix H with volumes plotted for future conditions; due to high projected 2050 volumes, those plotted points do not appear on the graph provided.

E 56th Ave & Road A

Warrant 1 (Eight-Hour Vehicular Volume) was met for this intersection in total future conditions with the site development in 2026 and 2050. The projected volumes for every hour from 7:00 AM – 7:00 PM were calculated for the major and minor road approach and were compared to Table 4C-1 from the MUTCD. Nine of the hours exceeded requirements for Condition A – Minimum Vehicular Volume.

Warrant 2 (Four-Hour Vehicular Volume) was met for this intersection during total future conditions in 2026 and 2050 since there were over four hours that the major/minor street volumes fall above the '2 or more lanes & 2 or more lanes' curve in Figure 4C-2. The graph for Warrant 2 is provided in Appendix H with volumes plotted for future conditions; due to high projected 2050 volumes, those plotted points do not appear on the graph provided.

Warrant 3 (Peak Hour) was met for this intersection with background and total future conditions in 2026 and 2050. All of the AM and PM peak hour volumes fell above the '2 or more lanes & 2 or more lanes' curve in Figure 4C-4. The graph for Warrant 3 is provided in Appendix H with volumes plotted for future conditions; due to high projected 2026 PM and 2050 volumes, those plotted points do not appear on the graph provided.

Plans show 250' of dual left turn storage

Include in this description if the storage length provided is existing or proposed. If proposed - please site who is responsible for this improvement. Also if the turn lane storage is based on single/dual lefts.

Highlight or bold to indicate where future storage exceeds available/planned storage. Also note if it is possible to lengthen the storage.

For this table, all turn lanes described are the proposed storage length. Roadway design with improvement responsibility is being submitted separately. Dual lefts were noted with superscripts.

Queues that would exceed the available storage were highlighted. Due to the high 8.5% growth rate, it is expected that the intersections will need to be reevaluated if/when growth occurs and the lane use and queueing would be updated at that time.

Notes : (1) Queue length, in feet, is based on the 95th percentile queue as reported by Synchro, Version 12.
 * Storage length per Skydane Development TIS

VII. Conclusions and Recommendations

Conclusions

Based on the results of this traffic impact study, the following may be concluded:

- Under existing traffic conditions, the unsignalized intersection movements will currently operate at overall acceptable levels of service (LOS) "C" or better during AM and PM peak hours except for the northbound and southbound movements at E 56th Ave & Picadilly Rd which operate at LOS "F". All queues remain within their respective storage lengths.
- Under background future 2026 and 2050 traffic conditions, without the proposed site development, delays would increase at study intersections due to regional traffic growth. The intersections are forecasted to operate at LOS "D" or better in 2026 and 2050 with the exception of E 56th Ave & Picadilly Rd which would operate at LOS "E" in 2050 due to regional growth. The unsignalized intersection movements are forecasted to be acceptable LOS "D" or better in 2026 and 2050 conditions with the exception of:
 - The EBLR approach at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 conditions.
 - The NBL movement at Maxwell Pl & Picadilly Rd which would operate at LOS "E" in 2050 conditions.
 - The EBL and SBR movements at E 56th Ave & Skydance Access which would operate at LOS "F" in 2050 PM conditions.
- Queues in background conditions remain within their respective storage lengths except for the ERI WBL, WBR, and NBR movements at the intersection.
- The proposed site development would generate, up to 1,000 weekday AM and 910 net new weekday PM peak hour weekday daily trips.
- Under total future 2026 and 2050 traffic conditions without the proposed site development, the intersections are forecasted to operate at LOS "D" or better with the exception of E 56th Ave & Picadilly Rd which would operate at LOS "E" in 2050 PM conditions due to regional growth. The unsignalized intersection movements would operate at LOS "D" or better in 2026 and 2050 conditions with the exception of:
 - The EBR movement at Maxwell Pl & Picadilly Rd which would operate at LOS "E" in 2050 AM conditions.
 - The WBR movement at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 PM conditions.
 - The NBL movement at Maxwell Pl & Picadilly Rd which would operate at LOS "E" in 2050 AM and PM conditions.
 - The SBL movement at Maxwell Pl & Picadilly Rd which would operate at LOS "F" in 2050 PM conditions.

It looks like the traffic volumes at 56th & Picadilly are pretty balanced. Was all-way stop control considered short term prior to signalization as an interim solution?

A signal is warranted in existing conditions, and the updated analysis shows an all-way stop that has movements operating at LOS "E" and "F", therefore a signal is required for build-out conditions.

Is there room to lengthen these lanes to provide adequate storage? Discuss impact of project traffic for these movements and mitigations proposed.

Mitigations for 2050 conditions are not being proposed due to the high growth rate and the unknown developments in the area. It is expected that the intersections will need to be reevaluated if/when growth occurs and the lane use and queueing would be updated at that time.

Include discussion of future signalized intersections and who is responsible for construction of these signals. Who is responsible for the widening of 56th Avenue east of Picadilly and these improvements?

Roadway design for Picadilly Rd and 56th Ave are being submitted separately and the responsibility of improvements and signals will be discussed then.

- The EBL movement at E 56th Ave & Skydance/N Site Access which would operate at LOS "F" in 2050 PM conditions.
- The SBR movement at E 56th Ave & Skydance/N Site Access which would operate at LOS "E" in 2050 PM conditions.
- Queues in total future conditions remain within their respective storage lengths except for the EBL, WBL, WBR, and NBR movements at the intersection of E 56th Ave & Picadilly Rd in 2050 conditions.

Recommendations

- It is recommended that the Applicant provide access consistent with the site plan contained herein.
- Site access should be provided via:
 - SBL lane and NBTR lane at Maxwell Pl & Picadilly Rd.
 - SBL, NBR, and EBTR lane at E 54th Ave & Picadilly Rd.
 - EBTR and WBL lane at E 56th Ave & Road A.
 - EBTR lane at E 56th Ave & N Site Access.
 - NBTR lane at W Site Access & Picadilly Rd.

Include turn lane lengths in these recommendations

This access may need to be restricted to right turns only due to the Picadilly Road Widening project and the 250' dual northbound left turn lanes at 56th Avenue.

The southbound left lane was removed and access to the site updated to a RIRO access.

Turn lane lengths were included in the recommendations section.

APPENDIX B – LOS Descriptions

Level of Service for Signalized Intersections

Level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort and frustration, fuel consumption, and lost travel time. Specifically, level-of-service (LOS) criteria are stated in terms of the average stopped delay per vehicle for a 15-min analysis period. The criteria are given in Exhibit 16-2. Delay may be measured in the field or estimated using procedures presented later in this chapter. Delay is a complex measure and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the v/c ratio for the lane group in question.

LOS A describes operations with very low delay, up to 10 sec per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.

LOS B describes operations with delay greater than 10 and up to 20 sec per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of average delay.

Exhibit 16-2. Level-of-Service Criteria for Signalized Intersections

LEVEL OF SERVICE	STOPPED DELAY PER VEHICLE (SEC)
A	≤ 10.0
B	$> 10.0 \text{ and } \leq 20.0$
C	$> 20.0 \text{ and } \leq 35.0$
D	$> 35.0 \text{ and } \leq 55.0$
E	$> 55.0 \text{ and } \leq 80.0$
F	> 80.0

LOS C describes operations with delay greater than 20 and up to 35 sec per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

LOS D describes operations with delay greater than 35 and up to 55 sec per vehicle. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

LOS E describes operations with delay greater than 55 and up to 80 sec per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.

LOS F describes operations with delay in excess of 80 sec per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. It may also occur at high v/c ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

Level of Service Criteria for Stop Sign Controlled Intersections

The level of service criteria are given in Table 17-2. As used here, control delay is defined as the total elapsed time from the time a vehicle stops at the end of the queue until the vehicle departs from the stop line; this time includes the time required for the vehicle to travel from the last-in-queue position to the first-in-queue position, including deceleration of vehicles from free-flow speed to the speed of vehicles in queue.

The average total delay for any particular minor movement is a function of the service rate or capacity of the approach and the degree of saturation. . . .

Table 17-2. Level of Service Criteria for TWSC Intersections

LEVEL OF SERVICE	AVERAGE CONTROL DELAY (sec/veh)
A	≤ 10
B	$> 10 \text{ and } \leq 15$
C	$> 15 \text{ and } \leq 25$
D	$> 25 \text{ and } \leq 35$
E	$> 35 \text{ and } \leq 50$
F	> 50

Average total delay less than 10 sec/veh is defined as Level of Service (LOS) A. Follow-up times of less than 5 sec have been measured when there is no conflicting traffic for a minor street movement, so control delays of less than 10 sec/veh are appropriate for low flow conditions. To remain consistent with the AWSC intersection analysis procedure described later in this chapter, a total delay of 50 sec/veh is assumed as the break point between LOS E and F.

The proposed level of service criteria for TWSC intersections are somewhat different from the criteria used in Chapter 16 for signalized intersections. The primary reason for this difference is that drivers expect different levels of performance from different kinds of transportation facilities. The expectation is that a signalized intersection is designed to carry higher traffic volumes than an unsignalized intersection. Additionally, several driver behavior considerations combine to make delays at signalized intersections less onerous than at unsignalized intersections. For example, drivers at signalized intersections are able to relax during the red interval, where drivers on the minor approaches to unsignalized intersections must remain attentive to the task of identifying acceptable gaps and vehicle conflicts. Also, there is often much more variability in the amount of delay experienced by individual drivers at unsignalized than signalized intersections. For these reasons, it is considered that the total delay threshold for any given level of service is less for an unsignalized intersection than for a signalized intersection. . . .

LOS F exists when there are insufficient gaps of suitable size to allow a side street demand to cross safely through a major street traffic stream. This level of service is generally evident from extremely long total delays experienced by side street traffic and by queueing on the minor approaches. The method, however, is based on a constant critical gap size - that is, the critical gap remains constant, no matter how long the side street motorist waits. LOS F may also appear in the form of side street vehicles' selecting smaller-than-usual gaps. In such cases, safety may be a problem and some disruption to the major traffic stream may result. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal gap acceptance behavior. The latter is more difficult to observe on the field than queueing, which is more obvious.

Fourth Edition December 2022

Fifth Edition: July 2023

Current Edition: September 2023

III. PROPOSED CONDITIONS

III.A. Trip Generation

The standard resource for estimating travel demand is *Trip Generation, 11th Edition*, Institute of Transportation Engineers (ITE), 2021. The development would consist of about 327 senior housing units, 54 units of single-family housing, 1,164 multifamily units, 683,700 square feet of retail space, and 386,400 square feet of office space. This analysis used a mix of the regression equations and average rates per dwelling unit and per thousand square feet for the corresponding ITE code. **Table I** outlines the ITE trip generation rates and equations for the applicable land use codes.

Table I. ITE Trip Generation Rates and Equations

Land Use	ITE Code	Unit	Daily	Peak	Equations & Rates	Distributions	
						In	Out
Single-family Detached	210	DU	$\ln(T)=0.92*\ln(X)+2.68$	AM	$\ln(T)=0.91*\ln(T)+0.12$	25%	75%
				PM	$\ln(T)=0.94*\ln(X)+0.27$	63%	37%
Single-family Attached	215	DU	$T=7.62*X+-50.48$	AM	$T=0.52*X+-5.7$	25%	75%
				PM	$T=0.6*X+-3.93$	59%	41%
Multifamily (Low-Rise)	220	DU	$T=6.41*X+75.31$	AM	$T=0.31*X+22.85$	24%	76%
				PM	$T=0.43*X+20.55$	63%	37%
Senior Housing Detached	251	DU	$\ln(T)=0.85\ln(X)+2.47$	AM	$\ln(T)=0.76*\ln(T)+0.16$	33%	67%
				PM	$\ln(T)=0.78*\ln(X)+0.2$	61%	39%
Hotel	310	Rooms	$T=7.99*X$	AM	$T=0.46*X$	56%	44%
				PM	$T=0.59*X$	51%	49%
Fitness Center	492	KSF	N/A	AM	$T=1.31*X$	51%	49%
				PM	$T=3.45*X$	57%	43%
Day Care	565	KSF	$T=47.62*X$	AM	$T=11*X$	53%	47%
				PM	$T=11.12*X$	47%	53%
General Office	710	KSF	$T=10.84*X$	AM	$T=1.52*X$	88%	12%
				PM	$T=1.44*X$	17%	83%
Medical Office Building	720	KSF	$T=42.97*X-108.01$	AM	$\ln(T)=0.9*\ln(X)+1.34$	79%	21%
				PM	$T=4.07*X-3.17$	30%	70%
Shopping Center	821	KSF	$T=67.52*X$	AM	$T=1.73*X$	62%	38%
				PM	$T=5.19*X$	49%	51%
Shopping Center	822	KSF	$T=42.2*X+229.68$	AM	$T=2.36*X$	60%	40%
				PM	$T=6.59*X$	50%	50%

Land Use	ITE Code	Unit	Daily	Peak	Equations & Rates		Distributions	
					In	Out	In	Out
Grocery Store	850	KSF	$T=93.84*X$	AM	$T=2.86*X$	59%	41%	
				PM	$T=8.95*X$	50%	50%	
Hardware Store	863	KSF	$T=30.74*X$	AM	$T=1.51*X$	57%	43%	
				PM	$T=2.29*X$	49%	51%	
High Turnover (Sit-Down) Restaurant	932	KSF	$T=107.2*X$	AM	$T=9.57*X$	55%	45%	
				PM	$T=9.05*X$	61%	39%	
Fast-Food Restaurant with Drive-Thru Window	934	KSF	$T=467.48*X$	AM	$T=44.61*X$	51%	49%	
				PM	$T=33.03*X$	52%	48%	
Gas Station	945	FP	$T=265.12*X$	AM	$T=16.06*X$	50%	50%	
				PM	$T=18.42*X$	50%	50%	

As shown in **Table 2**, the Green Valley MP Amendment 2 development would generate an estimated total of 52,000 new external vehicle trips per day with 2,739 in the AM and 4,364 in the PM. These trips are divided by assumed planning areas as shown in **Figure 2**. Given the National Cooperative Highway Research Program (NCHRP) 684 spreadsheet, an 8 percent daily internal capture rate was determined with 9 to 17 percent of the trips being internal for the AM and PM peak hours. **Appendix C** shows the NCHRP 684 internal capture summary sheets. Pass-by trips are those trips which are assumed to already use the roadway network, but decide to stop at a proposed use, if it is implemented. Land uses within this development that are assumed to generate pass-by trips would be restaurants, shopping centers, gas stations, hardware stores, and grocery stores. Pass-by estimates were assumed to be approximately 10 percent for each applicable land use based on engineering judgement.

Table 2. Trip Generation

III.B. Site Trip Distribution and Site-Generated Traffic Assignment

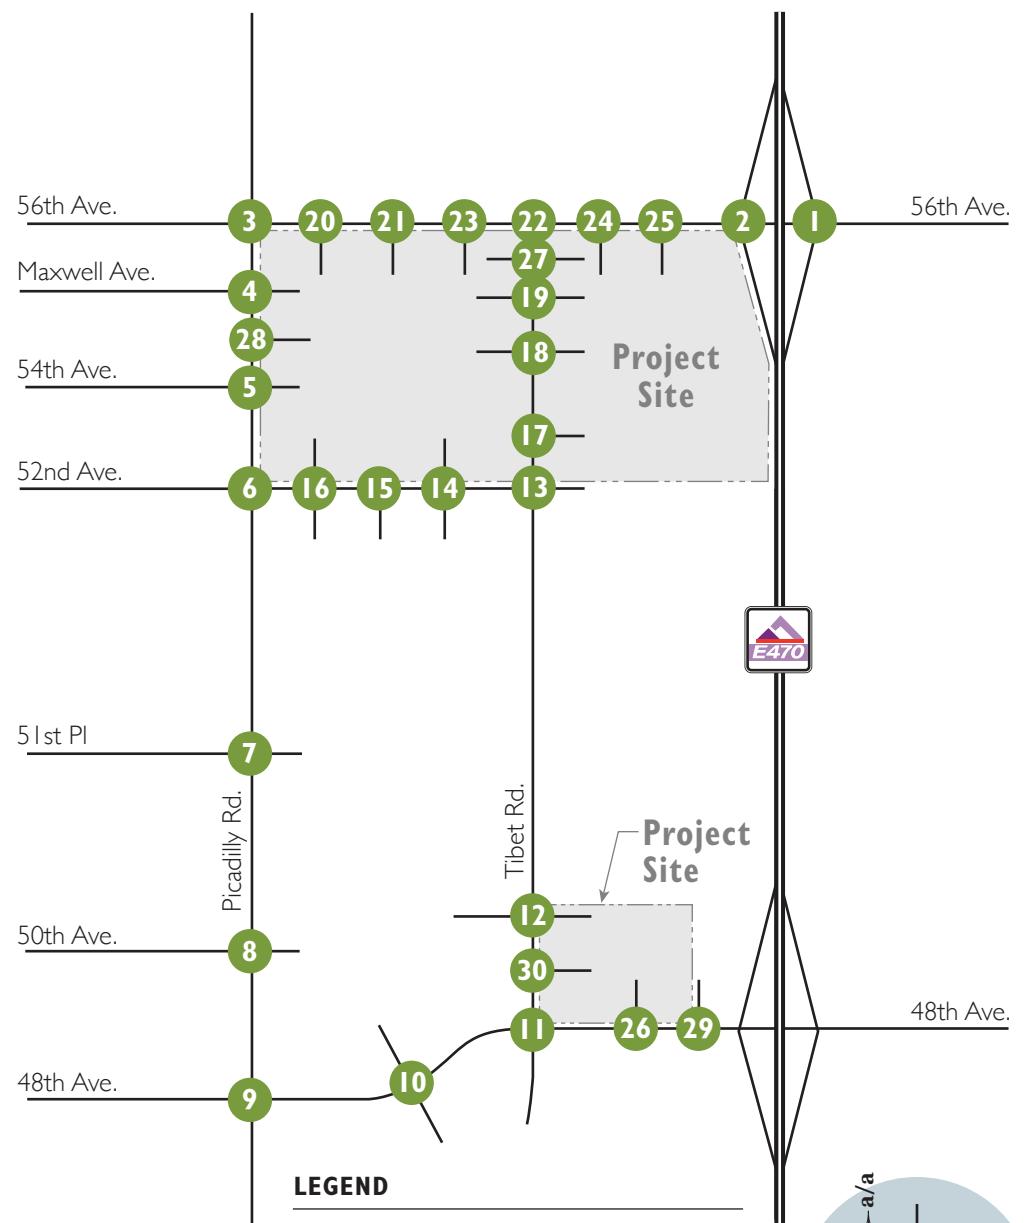

For the Short-Range Future scenario, it is expected that the Green Valley Ranch East MP Amendment I development will include construction (partial cross-sections) of the roadways immediately adjacent to the Green Valley MP Amendment 2 site, including 48th Avenue, Tibet Street, and 52nd Avenue. It is estimated that the existing two-lane cross-section on Picadilly Road would remain sufficient in the near term for purposes of this study.

The trip generation estimates from **Table 2** were assigned to the adjacent roadway system based on existing travel patterns, travel demand modeling information, and engineering judgment. The following distribution percentages were used to assign the site generated trips to the roadway network:

- 5 percent oriented to/from the north on Picadilly Road
- 10 percent oriented to/from the west on 56th Avenue
- 25 percent oriented to/from the north on E-470
- 25 percent oriented to/from the south on E-470
- 5 percent oriented to/from the east on 48th Avenue
- 5 percent oriented to/from the south on Tibet Street
- 10 percent oriented to/from the south on Picadilly Road
- 10 percent oriented to/from the west on 48th Avenue
- 5 percent oriented to/from the east on 56th Avenue

Internal trips were deducted from the trip generation total before assignments and are not reflected in the site generated trips. It should be noted that some internal trips may cross Tibet Street to reach other planning areas; however, these trips were not accounted for and Tibet is anticipated to see more east-west through volumes at site accesses than shown. Pass-by trips were assumed to travel through on 56th Avenue, Picadilly Road, 48th Avenue, and Tibet Street. Using an industry software tool, VISTRO, net new site generated trips were assigned to the network along with pass-by trips. **Figure 4** shows the site trip distribution and resultant traffic assignment including pass-by trips. As indicated, Picadilly Road would carry between 2,600 and 7,900 VPD of site traffic, 56th Avenue would carry about 5,200 west of Picadilly Road and 11,650 VPD east of Picadilly Road. 48th Avenue would carry between 5,200 VPD west of Picadilly and 6,500 VPD east of Picadilly Road in site-generated traffic.

5.2 Year 2030 Anticipated Transportation Network

For comparison purposes, this traffic study assumes that many of the planned roadways shown in the NEATS Refresh report and auxiliary lanes shown in other development traffic studies will be completed by Year 2030 background. If the future scenario was evaluated with the existing roadway network, then it would be difficult to compare intersection operates when many of the intersections will be altered and/or relocated and roadways widened which impacts the volumes, capacity, and routing. The following roadway and intersection improvements were assumed to be completed by Year 2030:

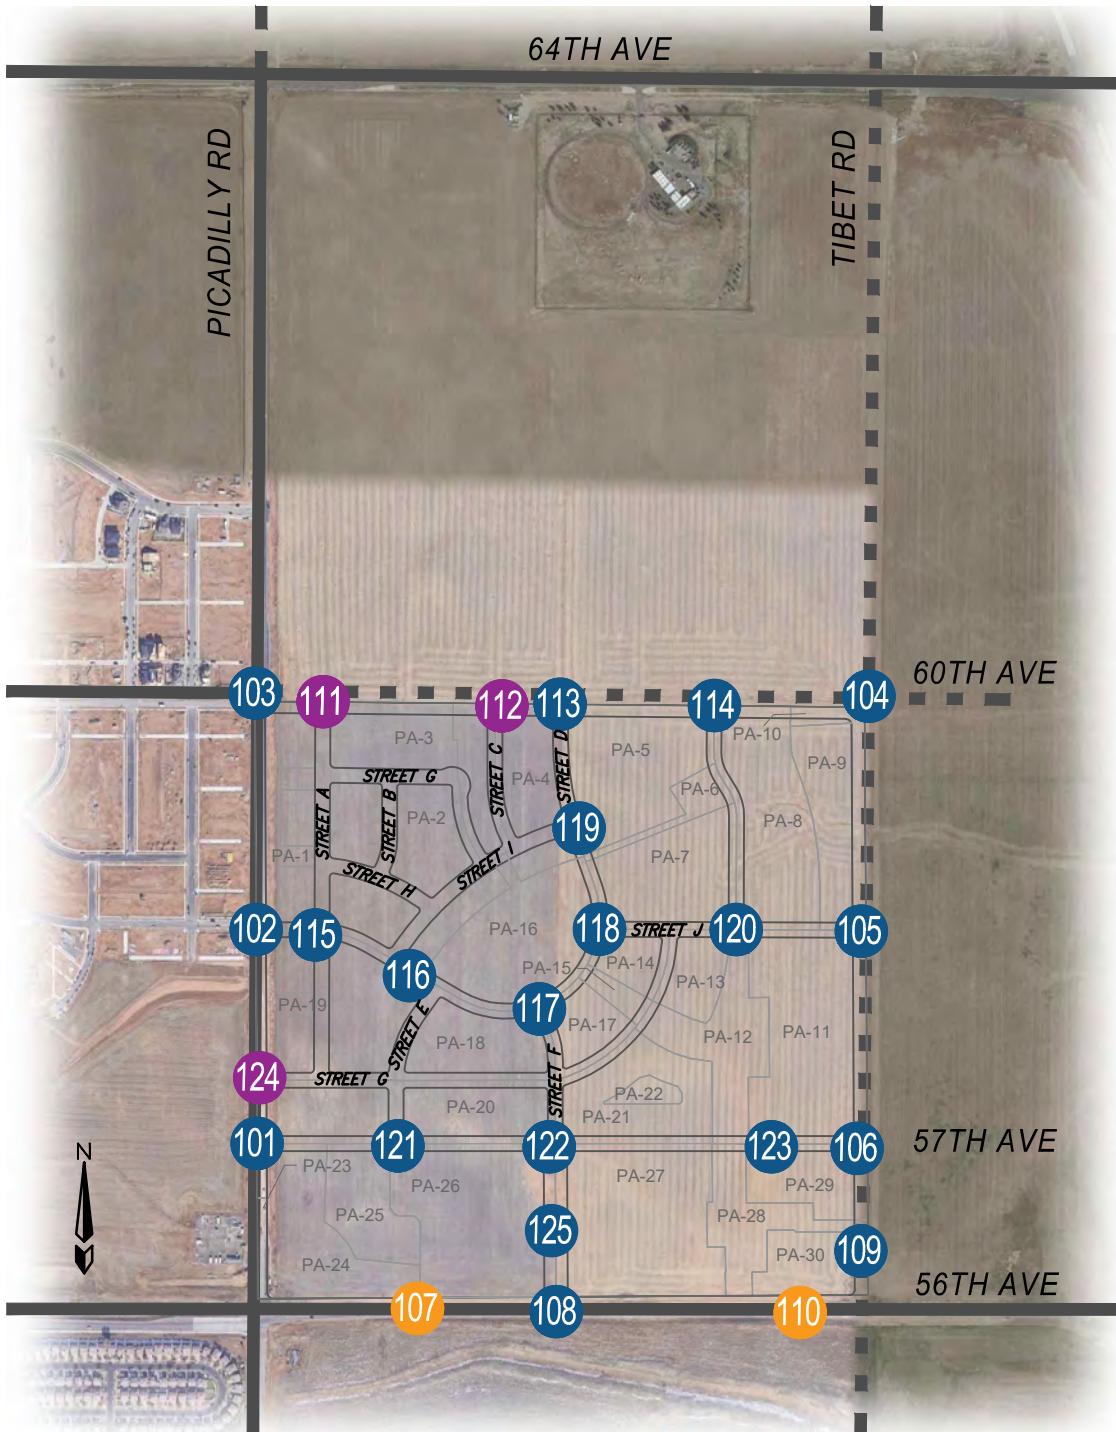

- **56th Avenue** – Widen to three lanes per direction.
- **64th Avenue** – Widen to three lanes per direction.
- **Picadilly Road** – Widen to three lanes per direction.
- **Tibet Road** – Constructed as a four-lane, minor arterial from south of 56th Avenue to north of 64th Avenue.
- **56th Avenue at Dunkirk Street** – Add second eastbound left-turn lane and add one eastbound right-turn lane. Add second westbound left-turn lane and add one westbound right-turn lane.
- **56th Avenue at Picadilly Road** – Signalize. Provide three through lanes on the east and west approaches (per NEATS Refresh). Provide three through lanes on the north and south approaches (per NEATS Refresh). Add dual left-turn lanes on each approach. Add one right-turn lane per approach.
- **56th Avenue at E-470 Southbound Ramps** – Signalize. Provide three through lanes on the east and west approaches (per NEATS Refresh). Add second westbound left-turn lane. Reconstruct off-ramp with dual southbound left-turn lanes and one southbound through lane.
- **56th Avenue at E-470 Southbound Ramps** – Signalize. Provide three through lanes on the east and west approaches (per NEATS Refresh). Reconstruct off-ramp with dual northbound left-turn lanes.
- **64th Avenue at Picadilly Road** – Signalize. Provide three through lanes on the east and west approaches (per NEATS Refresh). Provide three through lanes on the north and south approaches (per NEATS Refresh). Add dual left-turn lanes on each approach. Add one right-turn lane per approach.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Table 4C-1. Warrant 1, Eight-Hour Vehicular Volume
Condition A—Minimum Vehicular Volume

Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total of both approaches)				Vehicles per hour on higher-volume minor-street approach (one direction only)			
Major Street	Minor Street	100% ^a	80% ^b	70% ^c	56% ^d	100% ^a	80% ^b	70% ^c	56% ^d
1	1	500	400	350	280	150	120	105	84
2 or more	1	600	480	420	336	150	120	105	84
2 or more	2 or more	600	480	420	336	200	160	140	112
1	2 or more	500	400	350	280	200	160	140	112

Condition B—Interruption of Continuous Traffic

Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total of both approaches)				Vehicles per hour on higher-volume minor-street approach (one direction only)			
Major Street	Minor Street	100% ^a	80% ^b	70% ^c	56% ^d	100% ^a	80% ^b	70% ^c	56% ^d
1	1	750	600	525	420	75	60	53	42
2 or more	1	900	720	630	504	75	60	53	42
2 or more	2 or more	900	720	630	504	100	80	70	56
1	2 or more	750	600	525	420	100	80	70	56

^a Basic minimum hourly volume

^b Used for combination of Conditions A and B after adequate trial of other remedial measures

^c May be used when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000

^d May be used for combination of Conditions A and B after adequate trial of other remedial measures when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000
